“We have 10,000 users of more than 600 applications. After we installed Oracle Fusion Middleware, there was a substantial improvement in both accessibility and development work.” – Glenn Kenneth Bruun, IT Manager, Rikshospitalet

Rikshospitalet HF Implements Portal Solution and Reduces Paper Medical Records by 70%

Rikshospitalet HF was opened in 1826 and is Norway’s first university hospital. The business now comprises a merger of several state hospitals and is the country’s largest research hospital. Rikshospitalet HF handles a total of more than 300,000 patient contacts annually.

Challenges

- Consolidate patient and administrative data fragmented across the hospital’s 600 different applications and existing IT systems
- Create a single user interface with a low user threshold accessible to all medical personnel, with access to relevant applications and data catalogs to increase efficiency and productivity
- Create a secure channel of communication between health personnel, patients, and relatives

Solution

- Integrated Rikshospitalet HF applications with the help of a service-oriented architecture approach and Oracle Fusion Middleware
- Created a portal, accessible across the organization, to give employees access to relevant applications and data
- Customized the portal interface for each user’s job role and responsibilities in order to increase efficiency and productivity
- Created individual portals for patients, relatives, and employees with the help of Oracle Partner e-vita
- Reduced the volume of paper of medical records by more than 70%
