“Oracle’s JD Edwards World enterprise resource planning solution simplified our animal by-product collection processes and optimized our transport costs and logistics for public and private markets.” – Babou Seydi, Information Technology Director, SARIA Industries France

SARIA Industries France Optimizes Its Collection Processes for Greater Compliance and Efficiency

A subsidiary of SARIA Bioindustries, which is part of the German Rethmann Group, SARIA Industries France is the national market leader in collecting, processing, and generating value from animal by-products. Each year, SARIA handles close to 1.2 million tons of meat and fish by-products—some 42% of France’s annual processing volume of animal waste products. SARIA also is the French authorities’ leading partner in the rendering market.

Challenges

- Enable SARIA to meet its heavy logistical-requirements of more than 400 delivery rounds per day while complying fully with the Public Rendering Service’s requirements for electronic invoicing and traceability
- Enable real-time updating of animal by-product collection processes and make it easier to adapt logistical resources to demand and to seasonal variation
- Simplify overall operation of SARIA’s various sales, marketing, finance, production, quality control, and by-product collection processes

Solution

- Implemented a comprehensive enterprise resource planning (ERP) solution from Oracle’s JD Edwards World line of products, optimizing management of the company’s animal by-product collection processes
- Allowed for fast, easy development of an interface between a critical in-house application and the JD Edwards solution that helped streamline truck loadings in response to removal requests
- Consolidated data in real time, which improved tracking of by-product collection—an activity of strategic importance to SARIA
- Automated management of collection rounds for greater efficiency
- Achieved more efficient logistical management through the production of fast, accurate transportation cost-management reports that pinpoint mileage, tonnage, and fuel consumption
