“Valuable content belongs in a secure, central database where it can be easily managed, automatically backed up—ideally, with minimal man hours. There is nothing more important to us than our customer’s content, which is why we chose Oracle to secure our information and support our growth strategy.” – Andy Barrett, Chief Technology Officer, Yuntaa

Yuntaa Builds Web 2.0 Content Management System to Support Rapid Growth Objectives

Yuntaa, a Web 2.0 company based in Belgium, provides a range of feature-rich online services, including online backup, synchronization, and storage of audio and video files. In addition, the company provides customers with multi-media collaborative tools for sharing content and documents. With Yuntaa, organizations looking to incorporate Web 2.0 concepts—such as forums, wikis, file sharing, and instant messaging—into their businesses can do so securely, cost-effectively, and with minimal disruption to operations.

Challenges

- Support growth objectives with a central content management system that eliminates data integrity issues associated with storing Web 2.0 content and metadata in disparate locations
- Implement technology that provides customers with rapid, accurate, and reliable access to user-generated content
- Leverage a scalable platform to manage, administer, and backup multiple terabytes of Web 2.0 content on demand

Solution

- Implemented Oracle Database 11g with Oracle Partitioning as a content repository to maintain, secure, and back up metadata and Web 2.0 content in a central location
- Implemented Oracle Advanced Compression, resulting in lower storage costs, reduced disk space requirements, and improved application performance
- Built a solution that consistently backs up amended data, providing rapid switchover capabilities to a back-up storage solution
- Implemented Oracle Advanced Security with Securefile, offering the highest level of authenticated access to stored content, while mitigating the risk of data loss
- Maximized return on investment by creating a system that requires minimal time to manage and administer
