

SOLIX TECHNOLOGIES
Santa Clara, California

EMPLOYEES:
80

ORACLE PRODUCTS AND SERVICES:

Oracle Database 11g
Oracle Total Recall
Oracle Partitioning
Oracle Flashback

KEY BENEFITS:

- Ensures privacy through advanced data masking routines
- Manages high-volume data growth
- Archives database partitions

Solix Adds Advanced Data Management Features to Oracle Database 11g Features Including Oracle Total Recall and Oracle Partitioning

“Solix EDMS provides core value-add extensions to Oracle Database 11g that improve the functionality, ease-of-use, and cross-platform interoperability of the database for IT departments and end users. We believe our technology will help Oracle customers reduce costs while realizing better IT system performance and management.—Shekhar Dasgupta, President and COO, Solix Technologies

- Solix Technologies is a leading provider of data management solutions for custom applications built on Oracle Database 11g. Solix customers depend on Solix to ensure their Oracle 11g applications meet both privacy and long-term data retention requirements.
- Solix EDMS addresses both compliance and information lifecycle management requirements through four complementary solutions: Solix Enterprise Archiving, Solix Secure Test and Development, Solix Application Sun Setting and Migration, and Solix Data Auditor.
- Solix EDMS integrates with Oracle Total Recall to help customers effectively manage historical data capture and long-term retention in an application-transparent manner. Solix EDMS unique metadata-driven approach to managing enterprise data makes it easy for users to map business classification policies to Oracle Total Recall and Oracle Flashback on the back end.

Solix EDMS relocates and manages the Oracle Flashback archived data to an online active archive, helping to reduce the overall size of the production database and improve database performance while meeting compliance, regulatory, and business requirements. End users maintain access to the archived data while the data is migrated to a lower-cost infrastructure, also supporting tiered storage strategies.

Oracle Total Recall's compressed and application-transparent historical store capabilities power Solix's enterprise archiving product to help businesses manage data volume growth. With Oracle Total Recall, businesses can protect their current and historical data for the purposes of auditing and compliance in a secure and tamper-proof database.

Solix EDMS also integrates with Oracle Partitioning, which enables database tables to be split into smaller, more manageable components. This is a key requirement for any large database with high-performance and high-availability requirements. With Solix EDMS's central metadata manager, users can take advantage of Oracle Database 11g or get prepopulated support for Oracle Applications such as Oracle E-Business Suite, Oracle's PeopleSoft, Oracle's JD Edwards, and Oracle's Siebel CRM for transaction-based or partition-based archiving.

Solix EDMS also masks critical fields within the Oracle Database to ensure data privacy in test and production clones for custom applications utilizing Oracle Total Recall or Oracle Partitioning.

Oracle Database 11g supports some of the largest and most complex custom applications in the Fortune 2000. Solix Enterprise Data Management enhances the data management capabilities of Oracle Database 11g by archiving underutilized data to partitions or other databases to lower the total cost of ownership.

About Solix Technologies

Solix Technologies is a leading provider of enterprise data management solutions with proven success helping organizations worldwide meet compliance requirements and achieve information lifecycle management goals and strategies. Solix has an extensive global client base, including Fortune 500 companies, and is considered the standard for enterprise data management.
