Tai Yue China Software Certifies Ultra NMS 4.3 Network Management System Platform on Oracle Database 11g

With the continuous development of information technology, networks have become synonymous with progress. Large numbers of businesses and organizations are building and relying heavily on IT for all mission-critical activities, so networks have become a lifeline of modern enterprises.

Even though networks are a key to building a high-quality operation, network management and operations remain behind the pace of growing demands in the marketplace.

In order to meet these challenges, Tai Yue China Software used its years of experience in network management to create a business-oriented and integrated network management platform—Ultra NMS. This market-leading management solution helps enterprises manage their business operations and network environments to ensure high ROI on their IT assets.

Tai Yue chose Oracle Database 11g for its industry-leading performance, high availability, and scalability for all its clients, which range from small and midsize businesses to large enterprises in the telecom industry.

No other database in the market comes close to delivering what Oracle Database 11g can deliver. With industry-leading maximum availability features and the self-managing capabilities of the database server, Oracle Database 11g was a natural choice for a database platform.

About Tai Yue China Software
