

INFORMATION MANAGED

Total Healthcare Solutions for Better Outcomes—Oracle SecureCARE

With healthcare in the headlines on a regular basis, everyone seems to know something about the challenges. Unfortunately, the solutions are less obvious and can create more problems than they solve—until now.

Oracle SecureCARE Says It All

- Secure Collaboration
- Secure Analysis
- Secure Records
- Secure Exchange

Designed to address the complex challenges facing today's healthcare IT executives, Oracle SecureCARE combines industry-leading products with the Oracle standard of excellence to deliver total healthcare solutions.

CIOs in healthcare organizations today are looking in earnest for comprehensive, cost effective solutions that will provide real relief to the challenges of protecting, accessing, sharing, maintaining, and analyzing information in their organizations. In other words, they are looking for total information management solutions to address the challenges facing the healthcare industry and deliver better outcomes.

Solutions for Managing Healthcare IT

A complete healthcare IT solution must address challenges, concerns, and requirements from a variety of sources, including physicians, healthcare providers, state and local governments, regional healthcare information organizations, and federal health-related agencies.

Oracle SecureCARE brings best-of-class applications together into a total healthcare information technology (IT) solution that's integrated, innovative, and built on a name that has provided leading edge information

management solutions for more than 30 years. With Oracle SecureCARE, healthcare providers can

- Keep data secure and information private
- Access and share data and knowledge
- Generate reports and alerts
- Capture and maintain medical records at the point of care
- Exchange comprehensive clinical information or medical records

Keeping Data Secure and Information Private

Protecting information means providing a secure environment for keeping data secure. In the healthcare industry, however, protecting data also means ensuring the privacy of confidential patient information. And, because government privacy guarantees that patient privacy be regulated, healthcare organizations must be able to demonstrate their compliance with regulatory agency standards.

Fact: 17 of the top 20 hospitals in the U.S. trust Oracle for their healthcare solutions.

Oracle SecureCARE solutions provide the industry's most advanced technology for safeguarding your data. Our comprehensive security solutions protect data from internal and external threats and ensure privacy through operation policies, procedures, and technologies.

Access and Share Data and Knowledge

Protecting data is important, but organizations also need to provide patients and their families with timely access to that data along with tools to help them make informed decisions about their health management.

Oracle SecureCARE includes solutions for providing appropriate access to information for physicians, for patients, and for regulatory and public health agencies. Our secure, collaborative solution fully leverages the capabilities of Oracle Fusion Middleware and Oracle Database 11g, allowing practitioners to communicate and discuss medical cases privately. In addition, Oracle SecureCARE offers unique capabilities that let you specify compliance rules and confirm adherence.

Generate Reports and Alerts

Too often healthcare information management systems lack the tools to improve the quality, safety, and efficiency of healthcare services. A total IT solution for the healthcare industry must include the ability to analyze collected patient care information, assess programs and services for quality and cost effectiveness, and report information about care delivery to public health officials.

Oracle SecureCARE solutions let you perform timely analyses and provide support for your patients—from generating lists of patients who need follow-up phone calls or medication checks, to monitoring chronic conditions, to creating reports for patient registries and surveillance reporting.

Capture Data at the Point of Care

No matter what source the data comes from, no matter what format it takes, you need a information management system that can reliably capture medical information at the point it was created—at the point of care. As technologies become more integrated into the routine gathering of information, management systems must be able to handle large amounts of data in a variety of formats—from evidence-based order sets and computerized physician order entry (CPOE) to custom, legacy, or third-party data.

Oracle SecureCARE includes Oracle Database 11g, so you get the best in database innovation for capturing and maintaining medical records, including enterprisewide grid computing, secure records management, and a single source of information for reporting and analysis.

Exchange Clinical Information

Sharing clinical information between physicians and among other healthcare professionals is a critical part to providing meaningful use of healthcare information. Oracle SecureCARE provides next-generation, standards-based technology for the

secure exchange of information so patients can be treated in multiple locations without information gaps. The result?

- Physicians can exchange patient information in real time (or near real time)
- Patients have real-time access to information and can make timely healthcare decisions
- Healthcare professionals have access to information stored in different formats by different programs in different locations
- Healthcare providers can accurately measure the quality of care they give patients
- Healthcare organizations can provide timely access to a patient's lifelong healthcare information making it easier to treat and manage chronic care conditions

Providing Better Outcomes

By providing organizations with healthcare IT solutions that are comprehensive, secure, and cost effective, Oracle SecureCARE helps organizations improve the quality and effectiveness of their healthcare delivery systems, reduce redundancies, and provide better outcomes for their patients.
