Oracle Database 10g

KEY BENEFITS:

- Helped in out of the box Integration
- Combine applications to create composite applications
- Offers flexibility and rapid implementation
- Suit dynamic changing business processes

Click Commerce Uses Oracle® Fusion Middleware to Integrate Applications and Deliver New Product Offerings

""With Oracle Fusion Middleware, we are able to combine our own applications to create new composite applications that better serve our customers, as well as provide our customers with a set of technologies they can use to create their own composite applications that reflect their unique business processes." – Steve Cole, SVP, Product Management, Click Commerce

Click Commerce, Inc., a leading provider of on-demand supply chain management solutions, is using Oracle(r) BPEL Process Manager, a component of Oracle Fusion Middleware, to integrate its existing product portfolio and to deliver new offerings. As part of its strategic, long-term vision, Click Commerce is using Oracle BPEL Process Manager to power the company's Service-Oriented Architecture (SOA) that enables organizations to build composite applications, comprised of Click Commerce and third-party applications.

The Click Commerce Service Supply Chain Solution relies on Oracle software to flexibly integrate several products including warehouse management; returns and repairs management; supply chain execution and service parts optimization. The new offering provides real-time visibility and inventory control into service operations across the extended enterprise, helping to improve service levels, reduce costs for customers and provide market differentiation.

Click Commerce leverages Oracle Fusion Middleware Stacks

Click Commerce provides a range of on-demand solutions that support the unique business processes of multiple industry segments such as manufacturing, aerospace and defense, and high-tech. Over the past six months, Click Commerce has used Oracle Application Server 10g, Oracle BPEL Process Manager and Oracle Database 10g to create a composite application framework and an SOA. The first composite application delivered on this framework is the Click Commerce Service Supply Chain Solution. In addition, the company is using Oracle software and the composite application framework to create the Click Commerce Extended Order Management solution, which orchestrates the management of orders from businesses and consumers across an extended network of company-owned and third party facilities.
