INDUSTRY:

Converged Security and Identity Management

EMPLOYEES:

75

ORACLE PRODUCTS AND SERVICES:

Oracle Identity Manager

KEY BENEFITS:

- Streamlined operations, reduced costs
- User and group access definition, by title, role and location
- Easily manage vendors, suppliers and other third-party identities
- Easily connects to multiple PACS brands and with all major HR, IdM and LDAP systems

Quantum Secure and Oracle Deliver End-to-End Security for premier British Telco

“By integrating SAFE with Oracle Identity Manager, we are able to establish a single version of identity across all physical security systems, creating an end-to-end approach to identity management.” – Ajay Jain, CEO, Quantum Secure, Inc.

“We use Oracle Identity Manager across a host of deployments for our clients. With its ubiquitous nature, ease of integration and best-in-class approach, it is a natural fit with our SAFE software.” – Vik Ghai, CTO, Quantum Secure, Inc.

Quantum Secure is the exclusive provider of enterprise software to manage and streamline security identities, compliance and events across disparate physical security systems. Quantum Secure SAFE suite of software enables corporate security managers to implement best practices globally, automate key processes and simplify control of employees, vendors and other third-party identities across a global organization.

In implementing a successful security infrastructure, a security practitioner needs to bridge both the physical and logical security spectrums, integrating their existing physical security devices with their IT systems to create an end-to-end security solution for managing identities, compliance and events. By connecting their physical security operations closely to their IT infrastructure, security practitioners can quickly realize the value of security convergence, lower their overall level of risk and realize a very strong ROI.

Today’s Challenges for Global Security Organizations

With a heightened security consciousness across both corporate and government organizations, physical security practitioners are facing unprecedented scrutiny on their security operations. And despite this growing awareness and amplified level of investments, the number of security breaches (both internal and external) continues to soar. To compound this, practically all facility-based physical security systems, devices and services operate in silos, very loosely connected with one another. This problem becomes even more challenged by localized security processes, ad-hoc event handling, countless alarms and a lack of holistic reporting from multi-vendor systems.

To correctly assess their physical security readiness, security practitioners need a centralized approach to managing security identities, compliance and events across disparate physical security systems – one that works with their existing infrastructure – resulting in reduced operational costs and risk.

Quantum Secure and Oracle – An Integrated Platform for Premier British Telco

Oracle Identity Management platform, integrated with Quantum Secure's SAFE suite of enterprise software, provides complete end-to-end identity & access management across different physical access control (PAC) infrastructures from a centralized interface. Identities created and managed within HR, ERP and IT systems such as Oracle Identity Management can now be rolled into a seamless and automatically administered process, simplifying and ensuring governance, risk and compliance (GRC) efforts and enhancing overall levels of security. The combined solution ensures full identity lifecycle management in both IT and physical security domains.

Oracle's Identity Management's best-in-class suite of IdM solutions allows enterprises to manage the end-to-end lifecycle of user identities across all enterprise resources both within and beyond the firewall. You can now deploy applications faster, apply the most granular protection to enterprise resources, automatically eliminate latent access privileges, and much more.

Easily Implemented and Delivering Fast ROI

With a centralized, automated approach to managing identities, compliance and events, security practitioners can reduce manual, error-prone processes and streamline their operations and support staff needs. If infractions occur against pre-defined policies, SAFE can provide the capability for an organization to log any type of security policy infraction against managed identities, triggering notifications or automating access privilege changes.

With SAFE, security practitioners can find out in minutes whether swift action is needed and instantly update their corporate business-line managers. Thus, no one is pressured – often under fire – to make impactful decisions at a security level that may have hugely disruptive consequences such as building evacuations, plant shut-downs, network access closures.

Additionally, daily, weekly and monthly operational reports can be automatically generated and sent to respective individuals within the organization, providing security practitioners with the information needed to optimize staffing, budgeting and other related resources.

Additionally, because SAFE is a software solution, it works with your existing infrastructure – with no need to replace your existing physical security hardware. SAFE interfaces automatically with all leading physical security devices and technologies, and can be quickly customized to meet the needs of any security organization.

About Quantum Secure, Inc.

Quantum Secure's SAFE suite of software products effectively addresses the challenges associated with operating multiple proprietary physical security infrastructure systems in modern-day global corporations and government agencies. SAFE provides a single, fully interoperable and integrated physical security policy platform to manage and streamline security identities, compliance, events and operations across multiple disparate physical security systems.
