Further Information about the Oracle NoSQL Database 12
Oracle NoSQL offers value to customers looking at ACID transactions; geodistributed data; application security with authentication and session-level SSL encryption; and integration with Oracle Database, Oracle Wallet, and Hadoop.

Oracle NoSQL is a key-value database that delivers good performance, scale, security, and high availability capabilities.

**SOURCE: THE FORRESTER WAVE™: BIG DATA NOSQL, Q3 2016**

Oracle NoSQL Database on Oracle Cloud Overview

Many software engineering organizations are faced with the challenge of building systems to handle extremely-high throughput (10s of thousands writes/sec) while maintaining low latency (< 10 msec). The Oracle NoSQL Database running on the Oracle Cloud Infrastructure (OCI) easily handles these types of workloads in a secure, highly-available environment.

The Oracle NoSQL Database is a best-in-class NoSQL database that provides:

- High-performance distributed read/write capability using share-nothing architecture
- Linear scalability with transparent load rebalancing when new nodes are added
- Kerberos authentication, table-level authorization, and secure client/server and server/server communication
- Highly-configurable ACID transaction model
- Table model with SQL-like query capability

The OCI offers hourly metered Bare Metal instances; by eliminating the hypervisor Oracle can deliver better performance at a lower cost than traditional IaaS providers. In addition to compute unencumbered by a hypervisor, OCI offers instances with up to 28TBs of locally attached NVMe storage. Each 28TB instance (9 NVMe storage units) is capable of over 3 million 4K IOPs/sec.

OCI compute instances are attached via a 10Gb non-blocking network with no oversubscription. Each node has access to the full performance of the hardware, there are no “noisy neighbors” or hypervisors to share resources with. Instances in the same region are always less than 1ms from each other.

This Quick Start white paper is designed as a reference guide for deploying the Oracle NoSQL Database on the OCI platform. The following sections describe the preliminary setup of the OCI environment and then how to run the NoSQL cluster install scripts.
Assumptions

Consumers of this document should –

» Be familiar with the fundamentals of the Oracle Cloud Infrastructure
  » https://docs.us-phoenix-1.oraclecloud.com
» The OCI walkthrough is highly recommended if this is the first time you have used the platform
  » https://docs.us-phoenix-1.oraclecloud.com/Content/GSG/Reference/overviewworkflow.htm
» Have a basic understanding of Oracle NoSQL
  » Oracle NoSQL Database Concepts Manual

Planning an Oracle NoSQL Database Deployment on OCI

A minimal configuration for the Oracle NoSQL Database typically consists of a 3-node server cluster with a middle-tier application server between the end-user application and the Oracle NoSQL Database.

The middle tier can be an application server or web server that does not need much storage, but requires significant compute, memory and network resources. The backend database on the other hand usually requires large amounts of persistent storage.

There are 3 instance shapes for OCI Bare Metal –

<table>
<thead>
<tr>
<th>Oracle OCI Bare Metal Instance Shapes</th>
</tr>
</thead>
<tbody>
<tr>
<td>BM.StandardIO1.36</td>
</tr>
<tr>
<td>32GB local disk storage 36 cores 256GB memory</td>
</tr>
</tbody>
</table>

Standard instances are suitable for middle-tier services (e.g. web servers); High and Dense shapes have local direct attached storage and are recommended for high-performance database servers.

For this quick start guide we will walk through the steps of allocating a single Standard Shape middle-tier application server and 3 DenseIO NoSQL database server nodes. The database server nodes will be set up in 3 different Availability Domains (ADs) for enhanced reliability.

Outline of Steps to Get Oracle NoSQL Database Up and Running on OCI

The following steps outline the process to get Oracle NoSQL Database up and running on Oracle Bare Metal Cloud.
1. Set up OCI network and provision OCI instances
2. Acquire Oracle NoSQL Database License
3. Copy the Oracle NoSQL Database install scripts, Oracle JDK and Oracle NoSQL Database software to your local machine.

4. Run the Oracle NoSQL Database install script and verify the install was successful.

5. Run the server install script to install Oracle NoSQL Database components on an application server that will access the Oracle NoSQL Database.

6. Verify the application server can communicate with the Oracle NoSQL Database.

The details for these steps are contained in the following sections.

Create the Required OCI Network Resources

For this part of the process you will need to go to Oracle Cloud Infrastructure at https://console.us-phoenix-1.oraclecloud.com to set up an account, if not already done, then navigate the OCI UI to do the following steps. The Internet Gateway, Route Table, and Subnet configuration described below should be equivalent to the default settings when you create a new Virtual Cloud Network.

1. Create a new Virtual Cloud Network
   a. Name – Oracle_NoSQL_VCN
   b. CIDR block – 10.0.0.0/16

2. Create a new Internet Gateway
   a. Name - Oracle_NoSQL_Ig

3. Create a new Route Table
   a. Name - Oracle_NoSQL_RT
   b. CIDR block – 0.0.0.0/0
   c. Target – Oracle_NoSQL_Ig

4. Create Subnet 1
   a. Name – AD1_Oracle_NoSQL_private
   b. AD – PHX-AD-1
   c. CIDR block – 10.0.0.0/24
   d. Route table – Oracle_NoSQL_RT

5. Create Subnet 2
   a. Name – AD2_Oracle_NoSQL_private
   b. AD – PHX-AD-2
   c. CIDR block – 10.0.1.0/24
   d. Route table – Oracle_NoSQL_RT

6. Create Subnet 3
   a. Name – AD3_Oracle_NoSQL_private
   b. AD – PHX-AD-3
c. CIDR block – 10.0.2.0/24

d. Route table – Oracle_NoSQL_RT

7. Open Oracle NoSQL Ports

a. Go to Networking > Virtual Cloud Networks for your compartment

b. Click on your Virtual Cloud Network (Oracle_NoSQL_VCN)

c. Click Security Lists then click Default Security List for Oracle_NoSQL_VCN

d. Click Edit All Rules and add a rule with:

• Source CIDR: 10.0.0.0/16
• IP PROTOCOL: TCP
• SOURCE PORT RANGE: All
• DESTINATION PORT RANGE: 5000-5050

Create the Required OCI Compute Instances

1. Create BM.DenseIO compute instance 1 to run Oracle NoSQL DB storage node 1

   a. Name – Oracle_NoSQL_DB_AD1_0

   b. Image – Oracle-Linux-6.8-2017.01.09-0

   c. Shape – BM.DenseIO1.512

   d. AD – PHX-AD-1

   e. Cloud Network – Oracle_NoSQL_VCN

   f. Subnet – AD1_Oracle_NoSQL_private

   g. SSH Key – <public half of your key pair>

2. Create BM.DenseIO compute instance 2 to run Oracle NoSQL DB storage node 2

   a. Name – Oracle_NoSQL_DB_AD2_0

   b. Image – Oracle-Linux-6.8-2017.01.09-0

   c. Shape – BM.DenseIO1.512

   d. AD – PHX-AD-2

   e. Cloud Network – Oracle_NoSQL_VCN

   f. Subnet – AD2_Oracle_NoSQL_private

   g. SSH Key – <public half of your key pair>

3. Create BM.DenseIO compute instance 3 to run Oracle NoSQL DB storage node 3

   a. Name – Oracle_NoSQL_DB_AD3_0

   b. Image – Oracle-Linux-6.8-2017.01.09-0
c. Shape – BM.DenseIO1.512  
d. AD – PHX-AD-3  
e. Cloud Network – Oracle_NoSQL_VCN  
f. Subnet – AD3_Oracle_NoSQL_private  
g. SSH Key – <public half of your key pair>

4. Create one new “Standard Shape” compute instance to run the app server that will interface with your Oracle NoSQL Database  
a. Name – Oracle_NoSQL_AS_AD1_0  
b. Image – Oracle-Linux-6.8-2017.01.09-0  
c. Shape – BM.StandardO1.512  
d. AD – PHX-AD-1  
e. Cloud Network – Oracle_NoSQL_VCN  
f. Subnet – AD1_Oracle_NoSQL_private  
g. SSH Key – <public half of your key pair>

For each instance note the public and private (RFC1918) IP addresses in the table below. These IPs can be found in the OCI UI on the Compute > Instances > Instance Details page.

<table>
<thead>
<tr>
<th>Instance</th>
<th>Public IP</th>
<th>Private IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle_NoSQL_DB_AD1_0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Oracle_NoSQL_DB_AD2_0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Oracle_NoSQL_DB_AD3_0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Oracle_NoSQL_AS_AD1_0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NOTE: All communication between Oracle NoSQL Database nodes and associated app servers should be across the private address of the instances, not the public IPs. Using the public IP adds latency to the connection and limits the bandwidth. Using the RFC1918 private IP guarantees access to the full network bandwidth and the lowest possible latency. The public IPs can be used for external access, e.g. to ssh to the machines or as parameters to the Oracle NoSQL Database install scripts.

**Oracle NoSQL Database Zone and Replication Architecture**

The preceding compute instance setup has 3 OCI DenseIO instances (Storage Nodes), each having 9 3TB NVMe drives. By default the Oracle NoSQL Database uses a replication factor (RF) of 3 resulting in the following single-zone layout consisting of 9 shards.
In this case there is a 1-to-1 mapping between shards and the number of NVMe drives on each machine.

**Installing the Oracle NoSQL Database on OCI**

The following subsections describe the steps needed to install the Oracle NoSQL database on OCI.

**Download Oracle NoSQL Database Software and Oracle JDK**

Depending on which software license you own, you can download either Oracle NoSQL Database Enterprise Edition, Basic Edition or Community Edition as follows:

1) **Enterprise Edition** – Requires a commercial license from Oracle. This version can be downloaded for commercial use from the Oracle Software Download Cloud (edelivery.oracle.com).

2) **Basic Edition** – If you have an Oracle Database Enterprise Edition license you may use the Basic Edition at no additional cost, provided you are in compliance with the terms of the Oracle Database Enterprise Edition license agreement. You can download the Basic Edition from the Oracle Software Download Cloud (edelivery.oracle.com)

3) **Community Edition** – This version can be downloaded from the Oracle Technology Network (OTN) downloads page at:  

As an example, the Oracle NoSQL Database Community Edition can be downloaded to your local machine using the following command.

```
$ wget http://download.oracle.com/otn-pub/otn_software/nosql-database/kv-ce-4.3.11.tar.gz
```

Later, during the install process described below, this tar file will be uploaded to the OCI compute nodes.

Download the latest 64-bit JDK for RPM-based Linux Platforms (Note: Oracle NoSQL Database requires Java version 1.8 or greater). For example, go to  

and click on the link to download jdk-8u121-linux-x64.rpm to download the .rpm to your local machine.
Both the NoSQL tar.gz file and the JDK rpm files should be placed in the same directory as your NoSQL cluster install scripts so that the install scripts can copy them to the OCI compute nodes.

Scripts to Install and Configure the Oracle NoSQL Database

The install scripts allow you to install and configure the Oracle NoSQL Database from your local machine. The scripts can be run from a BASH or OS X shell. The install scripts can be downloaded from:

https://github.com/oracle-nosql/ons-bmc-byol

These scripts will automatically:

1. Install the NVMe file system on OCI nodes
2. Configure the OCI network and firewall ports for NoSQL storage nodes
3. Install operating system utilities and services needed for the Oracle NoSQL database, including
   a. Oracle JDK
   b. NTP service
4. Install the Oracle NoSQL Database
5. Configure and start up the Oracle NoSQL Database

The Oracle NoSQL Database cluster install script takes as input a list of IP addresses and runs the node install on each node in the IP list. The NoSQL cluster install script has the following form.

```
$ ./ons_cluster_install.sh --zone <zoneid> --store <dbname> <ipaddrs>
```

The script takes a zone name (e.g. PHX), a store value, which is the name of the Oracle NoSQL Database (e.g. ONSDB), and a list of IP addresses, which are the Public IP Addresses obtained from the OCI Compute > Instances > Instance Details page as noted above.

<table>
<thead>
<tr>
<th>ons_cluster_install.sh parameters:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>parameter</strong></td>
</tr>
<tr>
<td>--zone</td>
</tr>
<tr>
<td>--store</td>
</tr>
<tr>
<td>--capacity</td>
</tr>
<tr>
<td>--partitions</td>
</tr>
<tr>
<td>--username</td>
</tr>
<tr>
<td>--passphrase</td>
</tr>
</tbody>
</table>

The ons_cluster_install.sh script runs on a machine that has public key access to the database nodes; for example the machine with the public key that was provided during OCI compute instance creation above.
If any of the `ons_cluster_install.sh` parameters are missing the install program will prompt the user if necessary, as with the following example.

```
./ons_cluster_install.sh --zone PHX --store kvstore 129.146.1.1 129.146.2.2 129.146.3.3
Enter a passphrase to create a secure database.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Enter username (admin):
Enter capacity (9): 3
Enter partitions (90): 30
```

The cluster install script copies the local Oracle JDK `.rpm` and Oracle NoSQL Database `.tar.gz` to each node in the cluster. It then copies the `ons_node_install.sh` script to each node, runs the node install scripts in parallel and waits for them to complete. Once the installs are complete the admin node (first node in the list) is given a deployment plan that it uses to deploy the database to all storage nodes in the cluster.

The NoSQL install directory on your local machine should include the following files:

```
ons_cluster_install.sh  ons_node_install.sh  ons_server_install.sh
```

Your local install directory should also include some variation of the following:

```
jdk-8u121-linux-x64.rpm  kv-ce-4.3.11.tar.gz
```

The install scripts will automatically pick up the `j`dk and `kv` files based on their prefix/suffix patterns.

The following subsections provide some code snippets from the `ons_node_install.sh` script. These snippets are meant to give insight into the OCI system configuration.

**Script Details – File System Setup**

An OCI compute instance is delivered as a raw, bare-metal machine with Oracle Linux installed. It is necessary to do some initial hardware configuration, including formatting and mounting drives. The node install script runs the following file-system installation procedure on each node in the cluster.
Once the node install script completes you should see the following mounted volumes on each of the NoSQL nodes.

```bash
#!/bin/bash

# Insert mount script here

$ df -h
Filesystem      Size  Used Avail Use% Mounted on
/dev/sda3        38G  2.4G   34G   7% /
/tmpfs           252G     0  252G   0% /dev/shm
/dev/sda1       543M  280K  543M   1% /boot/efi
/dev/nvme0n1    2.9T   72M  2.8T   1% /ons/nvme0n1
/dev/nvme1n1    2.9T   72M  2.8T   1% /ons/nvme1n1
/dev/nvme2n1    2.9T   72M  2.8T   1% /ons/nvme2n1
/dev/nvme3n1    2.9T   72M  2.8T   1% /ons/nvme3n1
/dev/nvme4n1    2.9T   72M  2.8T   1% /ons/nvme4n1
/dev/nvme5n1    2.9T   72M  2.8T   1% /ons/nvme5n1
/dev/nvme6n1    2.9T   72M  2.8T   1% /ons/nvme6n1
/dev/nvme7n1    2.9T   72M  2.8T   1% /ons/nvme7n1
/dev/nvme8n1    2.9T   72M  2.8T   1% /ons/nvme8n1
```

### Script Details – Network Configuration

The Oracle NoSQL database needs to open ports for client/server and server/server communication. These port numbers are typically in the range 5000+ and will fit in the range 5000-5050 for a 9-shard cluster. Each 9-NVMe node requires 20 ports: 1 admin port, 1 client port and 2 ports per shard for inter-server communication. The node install script opens up ports as follows.

For Oracle-Linux release versions less than 7.0 it uses:

```bash
$ sudo /sbin/iptables -D FORWARD -j REJECT --reject-with icmp-host-prohibited
$ sudo /sbin/iptables -D INPUT -j REJECT --reject-with icmp-host-prohibited
```
For Oracle-Linux release versions 7.0 and greater it uses:

```bash
$ sudo firewall-cmd --permanent --zone=public --add-rich-rule='rule family="ipv4" source address="10.0.0.0/27" port protocol="tcp" port="5000-5050" accept'
```

**Script Details – NTP Installation**

NTP is installed to keep the clocks sync'd on the NoSQL database nodes. This is required for NoSQL replication.

Commands to install NTP and add ntpd to the boot configuration:

```bash
$ sudo yum -y install ntp
$ sudo service ntpd start
$ sudo chkconfig ntpd on
```

**Verifying the Oracle NoSQL Database Installation was Successful**

Once the install has completed you can log on to any of the storage nodes in the Oracle NoSQL Databases Cluster (using ssh opc@<database IP>) and verify the install was successful by issuing the following command:

```bash
$ java -jar $KVHOME/lib/kvstore.jar ping -host `hostname` -port 5000
```

This should produce something along the lines of the following:

Pinging components of store ONSDB based upon topology sequence #336
270 partitions and 3 storage nodes
Time: 2017-01-19 17:55:09 UTC Version: 12.1.4.3.11
Shard Status: healthy:9 writable-degraded:0 read-only:0 offline:0
Admin Status: healthy
Zone [name=PHX id=zn1 type=PRIMARY allowArbiters=false] RN Status: online:24 offline:0
maxDelayMillis:1 maxCatchupTimeSecs:0
Storage Node [sn1] on Oracle_NoSQL_DB_AD1_0:5000 Zone: [name=PHX id=zn1 type=PRIMARY
Storage Node [sn2] on Oracle_NoSQL_DB_AD2_0:5000 Zone: [name=PHX id=zn1 type=PRIMARY
Storage Node [sn3] on Oracle_NoSQL_DB_AD3_0:5000 Zone: [name=PHX id=zn1 type=PRIMARY

**Installing Oracle NoSQL Database Components on an Application Server**

As described above an application server is a middle-tier server that sits between between a client application and the Oracle NoSQL Database. An application server needs java components from the Oracle NoSQL Database to communicate with the Oracle NoSQL Database storage nodes. The ons_server_install.sh script installs these components and has the following form:

```
$ ./ons_server_install.sh --server <ipaddr> --dbnodes <ipaddr>
```
The server parameter is the server address where NoSQL server software will be installed. In the example configuration it would be the IP address of the Oracle_NoSQL_AS_AD1_0 server from the Creating Required OCI Compute Instances section above. The database nodes are the database public IP addresses from the Oracle NoSQL Database cluster, e.g. the IPs for Oracle_NoSQL_DB_* from above.

Connecting to the Oracle NoSQL Database from the Application Server

Once the application server is installed you should be able to log in (using account ‘opc’) and verify that it can communicate with the Oracle NoSQL Database.

Here’s an example test that can be run on the app server to verify things are working as expected:

```bash
$ ssh opc@appserver IP>
$ printf "1\n2\n3"/tmp/t.dat
$ java -Xmx256m -Xms256m -jar $KVHOME/lib/sql.jar -helper-hosts Oracle_NoSQL_DB_AD1_0:5000 -store ONSDB
sql-> create table t(i INTEGER, PRIMARY KEY (i));
Statement completed successfully
sql-> import -table t -file /tmp/t.dat CSV
Loaded 3 rows to t.
sql-> select i from t order by i;
+--+
| i |
+--+
| 1 |
| 2 |
| 3 |
+--+
```

Adding Multiple NoSQL Data Stores to OCI Compute Instances

By default the Oracle NoSQL Database install scripts create a single data store on a set of OCI compute instances. In some cases this might not be the best use of these compute resources. For instance, during an initial development phase you may want separate data stores for development, test and production that run on the same OCI hardware. These custom configurations can be implemented by running the ons_cluster_compile.sh script. For example, to install 3 databases – dev, test, and prod – on a single cluster run the following command:

```
./ons_cluster_compile.sh --zone PHX --store dev,test,prod -capacity 3 -partitions 30 -P "" 129.146.1.1 129.146.2.2 129.146.3.3
```
Appendix A - Running Oracle NoSQL Database on OCI VMs

It is possible to install Oracle NoSQL Database on OCI VMs with no attached storage. The following gives an example of how to create a 3-node Oracle NoSQL Database with each node having 3 block volumes attached.

1. Create the Required Block Volumes

   From the OCI UI (Storage>Block Volumes) create 9 block volumes, 3 in each Availability Domain (AD):
   
   Oracle_NoSQL_BV_AD1_0, Oracle_NoSQL_BV_AD1_1, Oracle_NoSQL_BV_AD1_2
   Oracle_NoSQL_BV_AD2_0, Oracle_NoSQL_BV_AD2_1, Oracle_NoSQL_BV_AD2_2
   Oracle_NoSQL_BV_AD3_0, Oracle_NoSQL_BV_AD3_1, Oracle_NoSQL_BV_AD3_2

   Each block volume should have 256GB of storage.

2. Create the Compute Instances

   From the OCI UI (Compute>Instances) create 3 VMs. Follow the instructions from the ‘Create the Required OCI Compute Instances’ section above, except use VM.Standard1.4 shapes instead of BM.DenseIO shapes.

3. Attach the Block Volumes to the Compute Instances

   Click on each virtual compute instance and add all three block volumes for the associated availability domain.

4. Run the install program

   Run ons_install_cluster as described previously, e.g.:

   ```
   ./ons_cluster_install.sh --zone PHX --store ONSDB 129.146.1.1 129.146.2.2 129.146.3.3
   ```
