<b>Tape Drives</b>	<b>2</b>
<b>Virtual Tape Libraries</b>	<b>5</b>
<b>Physical Tape Libraries</b>	<b>6</b>

**General Information**

Oracle Secure Backup supported tape devices will work with all supported operating systems unless otherwise noted in the comments.

Tape drives and tape libraries are independent; A supported library may utilize any supported tape drive as offered by the tape library manufacturer. Please confirm support for the tape drive and library.

Mixed media within one library is not supported by Oracle Secure Backup.

All devices on this matrix are considered to be supported by Oracle Secure Backup with all firmware versions currently supported by the manufacturer. The latest firmware version tested has been included as a reference. Oracle Secure Backup does not always test with newer firmware releases unless the vendor recommends re-testing based on a change(s) which may affect Oracle Secure Backup, however, newer versions are still supported. If a problem arises, it may be necessary to install the latest firmware tested until the issue resolved.

Oracle Secure Backup does not support tape drives or libraries that are not listed on this compatibility matrix.

SCSI and Fibre channel connectivity is qualified with all supported platforms. SAS connectivity is supported on Solaris SPARC, Linux, and Windows platforms.

If a tape device is no longer being manufactured, the availability has been noted as "Discontinued". Oracle Secure Backup continues to support these legacy devices as originally qualified.

The Virtual Tape Libraries (VTL) listed on this matrix are supported when configured to emulate tape drive(s) and/or tape libraries that are supported by Oracle Secure Backup.

This device support matrix is applicable to Oracle Secure Backup and Oracle Secure Backup Express as licensing permits.

This compatibility matrix includes the tape device "Product ID" which is the identifier that the device reports in response to a SCSI inquiry command.

If the Patch Req. column on this matrix indicates "yes", then the ob\_robots and ob\_drives files must be updated before deploying the device within an OSB domain. Please refer to My Oracle Support Note 420583.1 for instructions on obtaining and updating the files.

NDMP Direct Copy enables server-less tape duplication and is supported with virtual tape libraries as indicated above. The physical tape drives used for server-less duplication from virtual to physical tape may be shared drives (as in Storage Area Networks - SAN) or dedicated to the VTL. \* NDMP Direct Copy supported referred to as "Application Specific Path to Tape" option on VTL.
