## 3 Converting Forms6i FMTs to Oracle9i Forms FMBs

Converting a Forms6i FMT to an Oracle9i Forms FMB .................................................. 3-1

## 4 Built-ins, Packages, Constants, and Syntax

- Obsolete Menu Built-ins ................................................................................................. 4-1
- Other Obsolete Built-ins ................................................................................................. 4-3
- Obsolete Built-in Packages ........................................................................................... 4-5
- Obsolete Constants ........................................................................................................ 4-5
- Obsolete Syntax ............................................................................................................. 4-7

## 5 Triggers

- Obsolete Triggers ........................................................................................................... 5-1
- Stricter Enforcement of Triggers .................................................................................... 5-2

## 6 Properties

- Obsolete Properties ...................................................................................................... 6-1

## 7 Changes to Client-Server Deployment and Forms Runtime

- Effect on Forms Development ....................................................................................... 7-1
- Obsolete Forms Runtime Command Line Options ....................................................... 7-2
- Obsolete Character Mode Runtime ............................................................................... 7-2

## 8 Logical and GUI Attributes

- Use Visual Attributes to Replace Logical and GUI Attributes ...................................... 8-1
- Obsolete Logical and GUI Attributes ........................................................................... 8-1

## 9 Item Types

- Item Types Specific to Operating Systems ..................................................................... 9-1

## 10 List of Values (LOVs)

- Obsolete List of Values (LOVs) ..................................................................................... 10-1
11 User Exits
Obsoleted V2 User Exits ................................................................. 11-1

12 Menu Parameters
Predefined Menu Parameters .......................................................... 12-1
User-Defined Menu Parameters ..................................................... 12-2

13 Java-Related Issues
Using oracle.ewt Classes in Pluggable Java Components ...................... 13-1
JDK Versions and Font-Rendering Issues ........................................ 13-2

14 Integrating Reports and Graphics
Oracle Graphics6i ........................................................................... 14-1
Displaying Existing Charts in Oracle9i Forms .................................... 14-2
Editing Existing Chart Items ............................................................ 14-3
Oracle Reports ............................................................................... 14-3
Displaying Reports in Oracle9i Forms ............................................ 14-3
Example ..................................................................................... 14-3
Notes About the Example ............................................................... 14-5
Using Parameter Lists in RUN_REPORT_OBJECT ............................ 14-6
Migration Steps ........................................................................... 14-6

15 Migrating Client-Server Applications to the Web
Client-Server-Based Architecture .................................................... 15-2
Web-Based Architecture .................................................................. 15-3
Who Should Read this Chapter? ..................................................... 15-4
Guidelines for Migration ................................................................ 15-4

16 Upgrading from Pre-Forms6i Applications to Oracle9i Forms
About Upgrading Forms .................................................................... 16-1
Upgrading a Form ........................................................................... 16-1
PL/SQL 9 Support .......................................................................... 16-2
Compatibility with Earlier Versions of PL/SQL ................................. 16-2
List of Figures

15–1 Legacy Forms Server client-server-based architecture ................................................. 15-2
15–2 Forms Services Web-based architecture........................................................................ 15-3
List of Tables

1–1 Components Removed from the Developer Suite............................................................ 1-2
2–1 Oracle9i Forms Migration Assistant converter.properties File Options .................... 2-3
2–2 Oracle9i Forms Migration Assistant Command Line Parameters .............................. 2-6
4–1 Obsolete Menu Built-ins ............................................................................................. 4-1
4–2 Other Obsolete Built-ins .......................................................................................... 4-3
4–3 Obsolete Built-in Packages ...................................................................................... 4-5
4–4 Obsolete Constants ................................................................................................... 4-5
5–1 Obsolete Triggers ..................................................................................................... 5-1
5–2 Triggers with Restricted Usage ................................................................................ 5-2
6–1 Obsolete Properties .................................................................................................. 6-1
8–1 Obsolete Logical and GUI Attributes ........................................................................ 8-1
9–1 Obsolete Item Types ................................................................................................. 9-1
12–1 Obsolete Predefined Menu Parameters .................................................................. 12-1
15–1 Font Support for Web-based Applications ............................................................. 15-5
16–1 Version Number for Forms 4.5 Generate Command .............................................. 16-2
Send Us Your Comments

Oracle9i Forms Developer and Forms Services: Migrating Forms Applications from Forms6i, Release 9.0.2 for Windows and UNIX
Part No. A92183-01

Oracle Corporation welcomes your comments and suggestions on the quality and usefulness of this document. Your input is an important part of the information used for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most?

If you find any errors or have any other suggestions for improvement, please indicate the document title and part number, and the chapter, section, and page number (if available). You can send comments to us in the following ways:

- Electronic mail: oddoc_us@oracle.com
- Postal service:
  Oracle Corporation
  Oracle9i Forms Developer and Forms Services Documentation
  200 Oracle Parkway, 2op1224
  Redwood Shores, CA 94065
  USA

If you would like a reply, please give your name, address, telephone number, and (optionally) electronic mail address.

If you have problems with the software, please contact your local Oracle Support Services.
This manual describes:

- Features and functionality that have been removed from Oracle9i Forms Developer and Forms Services
- Information about migration events that automatically occur when you open or deploy a Forms6i application in Oracle9i Forms.
- Information about the Oracle9i Forms Migration Assistant, a tool to help you convert your applications.
- Information about steps that developers, system administrators, and DBAs need to take to migrate Forms applications from Forms6i to Oracle9i Forms.

**Intended Audience**

This manual is intended for developers, system administrators, and DBAs who develop and deploy Oracle9i Forms applications.

**Structure**

This manual contains the following chapters:

**Chapter 1, "Why Migrate?"**

This chapter explains why Oracle9i Forms is desupporting a number of features and replacing them with new functionality. It also lists the Forms6i features and the Developer suite components that have been removed for the 9i release.
Chapter 2, "Using the Oracle9i Forms Migration Assistant"
This chapter describes the Oracle9i Forms Migration Assistant, a tool that will help you migrate Forms applications from Forms6i to Oracle9i Forms. This tool will help you detect and migrate obsolete features.

Chapter 3, "Converting Forms6i FMTs to Oracle9i Forms FMBs"
This chapter describes how to convert Forms6i FMTs and MMTs to Oracle9i Forms FMBs and MMBs.

Chapter 4, "Built-ins, Packages, Constants, and Syntax"
This chapter describes the PL/SQL built-ins, packages, constants, and syntax that have been removed for the 9i release and information that will help you replace the obsolete functionality.

Chapter 5, "Triggers"
This chapter describes the triggers that have been removed for the 9i release and information that will help you replace the obsolete functionality.

Chapter 6, "Properties"
This chapter describes the properties that have been removed for the 9i release and information that will help you replace the obsolete functionality.

Chapter 7, "Changes to Client-Server Deployment and Forms Runtime"
This chapter describes the runtime changes for the 9i release and information that will help you replace the obsolete functionality.

Chapter 8, "Logical and GUI Attributes"
This chapter describes the logical and GUI attributes that have been removed for the 9i release and information that will help you replace the obsolete functionality.

Chapter 9, "Item Types"
This chapter describes the items that have been removed for the 9i release and information that will help you replace the obsolete functionality.

Chapter 10, "List of Values (LOVs)"
This chapter describes the LOVs that have been removed for the 9i release and information that will help you replace the obsolete functionality.
Chapter 11, "User Exits"
This chapter describes the user exits that have been removed for the 9i release and information that will help you replace the obsolete functionality.

Chapter 12, "Menu Parameters"
This chapter describes the menu parameters that have been removed for the 9i release and information that will help you replace the obsolete functionality.

Chapter 13, "Java-Related Issues"
This chapter describes migration steps to take if your Forms applications use Java-related components.

Chapter 14, "Integrating Reports and Graphics"
This chapter describes changes that you need to make to Forms applications in order to integrate existing Graphics6i and Reports applications.

Chapter 15, "Migrating Client-Server Applications to the Web"
If you deployed Forms applications in a client-server environment in the past, use the information in this chapter to understand the changes you need to make in order to deploy your Forms applications on the Web. Additional information is available in the manual Oracle9iAS Forms Services Deployment Guide (Part No. A92175-01).

Chapter 16, "Upgrading from Pre-Forms6i Applications to Oracle9i Forms"
This chapter contains hints to help you convert pre-Forms 6i applications to Forms6i. After converting applications to Forms6i, you can migrate to Oracle9i Forms.

- Forms Developer Online Help, available from the Help menu in Forms Developer.

In addition, you will find white papers and other resources at http://otn.oracle.com.
Why Migrate?

Oracle9i Forms Developer and Forms Services have been upgraded to simplify the development and deployment of Forms applications on the Web. A number of new features have been added. In restructuring the Oracle9i Forms product, some legacy features have been dropped or scaled back. The future of Forms includes improving the Java-based Web user interface and extending product "openness" by allowing Java integration on all three tiers.

For customers who do not want to migrate, Oracle Forms6i still contains the features that have been removed in the Oracle9i Forms release. Forms6i will be supported until 2006, with extended support available as an option until 2008.

Features Removed from Oracle9i Forms

The following have been dropped from Oracle9i Forms:

- Client-server runtime
- Character mode runtime
- Various runform command line options
- Character mode properties and logical attributes
- Item types that are operating-system specific
- Various built-ins
- Various properties
Components Removed from the Developer Product Suite

- Various menu features including:
  - Character mode menu properties
  - Obsolete types from the Menu-Items command type property
  - Menu parameters
  - Menu built-ins
  - Full screen menu style
  - Bar (Lotus) menu style
- Forms version 2 style triggers and list of values (LOVs)
- Graphics Chart Wizard

In addition, rules enforcing trigger usage have become more strict.

Components Removed from the Developer Product Suite

The following components have been removed.

<table>
<thead>
<tr>
<th>Obsolete Component</th>
<th>Migration Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Graphics</td>
<td>If your applications use the Graphics Web Cartridge or Oracle Graphics Runtime, you should remain on Forms6i.</td>
</tr>
<tr>
<td></td>
<td>You can upgrade and deploy existing Forms applications that contain embedded Oracle Graphics using the RUN_PRODUCT call, or by displaying them as chart objects. To do this, you must install Oracle Graphics6i on the same machine as Oracle9i Forms Services, but in a separate ORACLE_HOME.</td>
</tr>
</tbody>
</table>
### Table 1–1 Components Removed from the Developer Suite

<table>
<thead>
<tr>
<th>Obsolete Component</th>
<th>Migration Notes</th>
</tr>
</thead>
</table>
| Oracle Forms Listener and Load Balancing Components | Use the Forms Listener Servlet to manage Forms sessions on the Web. The Forms Listener Servlet provides:  
- Improved security because all traffic is directed through standard Web server HTTP or HTTPS ports, with no extra ports open through the firewall.  
- Use of non-proprietary load balancing utilities.  
- Broader firewall and proxy support.  
- Less administration because the listener and load balancing processes do not need to be managed.  
- Simplified HTTPS support because a separate Web server SSL certificate for the Forms listener is not required.  
- HTTPS support for Internet Explorer 5.x with native JVM. |
| Oracle Forms Server Cartridge and CGI | Use the Forms Servlet. The functionality available with the Oracle Forms Server cartridge and CGI was incorporated into the Forms Servlet, which was first available in Oracle Forms Release 6i patchset 2. |
| Oracle Procedure Builder | Use the facilities for editing and debugging local and server-side PL/SQL code in Oracle9i Forms Developer, which has been considerably improved for this release. |
| Oracle Project Builder | No migration path or replacement functionality at this time. However, a future release of Forms Developer will be project-based rather than module-based, thus providing equivalent functionality. |
| Oracle Translation Builder | Use TranslationHub to translate resource strings in Forms modules in order to deploy the modules in multiple languages. |
| Oracle Query Builder/Schema Builder | No migration path or replacement functionality. |
| Oracle Terminal | The resource files used by Web-deployed forms are text based and can be edited using a conventional text editor. As a result, Oracle Terminal is no longer required for the product. |
| Open Client Adapters (OCA) | In order to provide platform-independent access to a wider range of non-Oracle data sources, use the Oracle Transparent Gateway and Generic Connectivity solutions in place of OCA. |
| Tuxedo Integration | No migration path or replacement functionality. |
How are Obsolete Item Types Handled when Migrating Forms6i Applications?

When you open a Forms application, obsolete item types are listed at the end of the item-type poplist in the Property Palette. The property values for obsolete items are indicated as obsolete. For example, the property value for VBX would be "VBX Control (Obsolete)".

Note: If you are migrating from older releases of Forms to Oracle9i Forms, you must first migrate your applications to Forms6i, and then migrate them to Oracle9i Forms. See Chapter 16, "Upgrading from Pre-Forms6i Applications to Oracle9i Forms" for more information.

You can use the Oracle9i Forms Migration Assistant, described in Chapter 2, "Using the Oracle9i Forms Migration Assistant", to resolve many migration issues.

Are Tools Available to Assist with the Migration of Obsolete Features?

The Oracle9i Forms Migration Assistant is provided with Oracle9i Forms to help you migrate your Forms6i applications. See Chapter 2, "Using the Oracle9i Forms Migration Assistant" for details.

---

---
Using the Oracle9i Forms Migration Assistant

Oracle9i Forms provides a tool that updates obsolete usage in your PL/SQL code in order to migrate your Forms6i applications to Oracle9i Forms. The tool issues warnings when it cannot make the required changes automatically.

This chapter contains the following sections:

■ "What Does the Oracle9i Forms Migration Assistant Do?"
■ "Editing the converter.properties File"
■ "Editing the search_replace.properties File"
■ "Starting the Oracle9i Forms Migration Assistant"

Go to http://otn.oracle.com for the latest version of the tool.

What Does the Oracle9i Forms Migration Assistant Do?

The Oracle9i Forms Migration Assistant does the following for all Forms module types (including object libraries and PL/SQL libraries):

■ Updates PL/SQL code where possible, for example:
  ■ Updates RUN_PRODUCT to the RUN_REPORT_OBJECT built-in when used to call Reports.
  ■ Updates CHANGE_ALERT_MESSAGE to the SET_ALERT_PROPERTY built-in.
Editing the converter.properties File

- Provides a list of obsolete code usage, including code that the tool cannot change when there is not a straight-forward equivalent for migration, for example:
  - Provides warnings when specific obsolete built-ins are used at runtime, such as DISABLE_ITEM, ENABLE_ITEM, and ITEM_ENABLED.

Note: The Oracle9i Forms Migration Assistant replaces built-ins and issues warnings about built-ins that exist within code comments.

- Provides warnings when obsolete functionality is encountered, such as when obsolete item types are included in the code.
- Provides warnings about triggers defined at incorrect levels.

You run the Oracle9i Forms Migration Assistant in batch mode. You can re-enter the utility as needed to run the migration process on a Forms application more than once.

By editing the converter.properties file, you can set options before you start the batch migration. By editing the search_replace.properties file you can specify the strings that the Oracle9i Forms Migration Assistant will search for and replace, and edit the warnings that are issued when an obsolete built-ins is encountered.

The tool creates a log file so that you can navigate to problem areas in the application and make modifications manually.

Editing the converter.properties File

To change migration options, edit the converter.properties file in a text editor.
You can set the following migration options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log File Name (default.logfilename)</td>
<td>Specifies the file name and location for log information.</td>
</tr>
<tr>
<td>Reports Queue Table Installed (default.usequeueutables)</td>
<td>When using web-based reports or ORARPP (Oracle Reports Remote Printing), these queue tables can be used to monitor queued and processed reports. When used with the Oracle9i Forms Migration Assistant, the queue table provides detailed error messages when installed in the application schema. (For example, if a report cannot run due to uncompiled PL/SQL, you can use the queue table to query for full error messages.) The resulting report is automatically printed. See the Reports Services documentation for more information about the Reports Queue Table.</td>
</tr>
<tr>
<td>Reports Servlet Directory (default.servletdir)</td>
<td>Specifies the name that has been defined for the virtual path used for the Reports Servlet, which is used for running reports on the web. This setting is required when converting Run_Product calls to Run_Report_Object.</td>
</tr>
<tr>
<td>Reports Servlet Name (default.servletname)</td>
<td>Specifies the name for the Reports Servlet used for running reports on the web. This setting is required when converting Run_Product calls to Run_Report_Object.</td>
</tr>
<tr>
<td>Reports Server Host (default.reports_servername)</td>
<td>The name or IP address of the machine running the Reports Server. This setting is required when converting Run_Product calls to Run_Report_Object.</td>
</tr>
<tr>
<td>User Name (default.connectusername)</td>
<td>The username to connect to the database.</td>
</tr>
<tr>
<td>Password (default.connectpassword)</td>
<td>The password to connect to the database.</td>
</tr>
<tr>
<td>Database (default.connectdb)</td>
<td>The database name.</td>
</tr>
<tr>
<td>Connect to Database (default.connecttodb)</td>
<td>If true, database connection is established. If false, then database connection is not established.</td>
</tr>
<tr>
<td>Compile After Conversion (default.generateruntime)</td>
<td>If true, the module is compiled after conversion (for example, an .fmx, .mmx, or .plx is generated).</td>
</tr>
<tr>
<td>DESTYPE (default.destype)</td>
<td>The type of destination device that will receive the report output. See the Reports Developer Reference for details.</td>
</tr>
</tbody>
</table>
Editing the search_replace.properties File

The search_replace.properties file contains the strings that the Oracle9i Forms Migration Assistant will search for and replace. It also contains a list of obsolete built-ins that will generate warnings.

Adding Search-and-Replace Strings

You can edit this file to add your own search-and-replace strings, as follows:

1. Open the search_replace.properties file in a text editor.
2. Go to the end of the list of search-and replace strings.
3. Add a string to search for and replace using the following syntax:
   
   `SearchString|ReplaceString`

   
4. Save the search_replace.properties file.

**Note:** Do not delete the last two commands in the search_replace.properties file. See the release notes for more information.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESFORMAT (default.desformat)</td>
<td>The printer driver to be used when DESTYPE is FILE. See the Reports Developer Reference for details.</td>
</tr>
<tr>
<td>DESNAME (default.desname)</td>
<td>The name of the file, printer, e-mail ID, or distribution list to which the report output will be sent. See the Reports Developer Reference for details.</td>
</tr>
<tr>
<td>Oracle Reports Remote Printing (default.use_orarrp)</td>
<td>ORARPP is a utility available on OTN for printing report output created by the Reports Server. See the Reports Developer Reference for details.</td>
</tr>
<tr>
<td>ORARPP Virtual Directory (default.orarrp_virtual_directory)</td>
<td>Web Server virtual directory mapped to the directory defined in Orarrp Physical Directory.</td>
</tr>
<tr>
<td>ORARPP Physical Directory (default.orarrp_physical_directory)</td>
<td>Web Server physical directory where Reports output files are created.</td>
</tr>
<tr>
<td>Reports Server Host (default.reportshost)</td>
<td>The name or IP address of the machine running the Reports Server. This setting is required when converting Run_Product calls to Run_Report_Object.</td>
</tr>
</tbody>
</table>

Table 2–1 Oracle9i Forms Migration Assistant converter.properties File Options
Modifying Warnings for Obsolete Built-Ins

The warnings for built-ins have the following syntax:

- `<class>.Message=<WarningMessage>`
- `<class>.Warning1=<BuiltIn1>`
- `<class>.Warning2=<BuiltIn2>`
- `<class>.Warning3=<BuiltIn3>`
  etc.

For example, for the class `obsoleteMenuParam`, the warnings are coded as follows:

- `obsoleteMenuParam.Message=Menu Parameters are no longer supported, the parameter and usage of %s should be replaced using a Forms parameter or global variable.`
- `obsoleteMenuParam.Warning1=MENU_PARAMETER`
- `obsoleteMenuParam.Warning2=QUERY_PARAMETER`
- `obsoleteMenuParam.Warning3=TERMINATE`

`<class>` is a group of built-ins that have a common warning.
`<WarningMessage>` can contain one variable string (`%s`).

When the Oracle9i Forms Migration Assistant finds a built-in for which a warning should be issued, it logs the warning and replaces the variable string (`%s`) with the built-in name.

Classes that have already been created in the `search_replace.properties` file are:

- `obsoleteItemTypeBuiltin`
- `obsoleteBuiltin`
- `obsoleteMenuParam`
- `obsoleteItemTypeConstantProp`
- `obsoleteConstantProp`
- `obsoleteConstant`
- `obsoleteHardCodedUserExit`
- `obsoleteComplexBuiltin`
- `obsoleteCallBuiltin`

You can add more built-in warnings to an existing class, or create new classes and warnings:

1. Open the `search_replace.properties` file in a text editor.
2. Go to the end of the list of warning messages.

3. Add a warning to an existing class or create new classes and warnings using the syntax described above.

4. Save the search_replace.properties file.

**Note:** Do not delete the last two commands in the search_replace.properties file. See the release notes for more information.

**Starting the Oracle9i Forms Migration Assistant**

It is recommended that you first migrate common modules that other modules depend on.

**Note:** For Solaris, an xterm display is required to run the Oracle9i Forms Migration Assistant.

**Note:** The forms90\rp2rrp.dll file should be in the FORMS90_PATH in order to convert Run_Product to Run_Report_Object.

To start the Oracle9i Forms Migration Assistant on Windows, type

```
ifplsqlconv90 module=<modulename> userid=<userid> log=<log>
```

To start the Oracle9i Forms Migration Assistant on Solaris, type

```
f90plsqlconv module=<modulename> userid=<userid> log=<log>
```

<table>
<thead>
<tr>
<th><strong>Table 2–2 Oracle9i Forms Migration Assistant Command Line Parameters</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Parameter</strong></td>
</tr>
<tr>
<td>----------------</td>
</tr>
<tr>
<td>modulename (required)</td>
</tr>
<tr>
<td>userid (optional)</td>
</tr>
<tr>
<td>log (optional)</td>
</tr>
</tbody>
</table>
Information about the progress of the migration process is displayed on the screen. It is also saved to the log file that you specify in the converter.properties file. (To change migration options, see Editing the converter.properties File.)

Check the log file for information about required migration steps that the tool did not modify. Manually make these changes to your application.

**Migrating Multiple Files**

On Windows NT, create a batch file (for example upgrade.bat) that contains the following:

```
for %%file in (%1) do call ifplsqlconv90 module=%%file
```

Then run the batch file as follows:

```
upgrade *.fmb
```

or

```
upgrade foo*.mmb
```

On Solaris, create a shell script (for example upgrade.sh) that contains the following:

```
for file in $*
  do
    f90plsqlconv.sh module=$file
  done
```

Then run the shell script as follows:

```
upgrade.sh *.fmb
```

or

```
upgrade.sh foo*.mmb
```
Converting Forms6i FMTs to Oracle9i Forms FMBs

Because some properties are obsolete in Oracle9i Forms, you cannot directly convert Forms6i FMTs and MMTs to Oracle9i Forms FMBs and MMBs using Oracle9i Forms Developer.

Converting a Forms6i FMT to an Oracle9i Forms FMB

To convert a Forms6i FMT or MMT to an Oracle9i Forms FMB or MMB, do the following:

1. Use the Forms6i Builder or Compiler to convert the Forms6i FMT or MMT to a Forms6i FMB or MMB.
2. Then, use Oracle9i Forms Developer to convert the Forms6i FMB or MMB to an Oracle9i Forms FMB or MMB.
In order to streamline the tools available and simplify the development process for building Forms applications for the Web, built-ins, constants, packages, and some syntax that are not applicable to Web deployment have been removed.

### Obsolete Menu Built-ins

Menus associated with full-screen display and character mode have been removed. Code that contains these built-ins will not compile and should be recoded, although exceptions are mentioned in the following table. Built-ins that are equivalent to obsolete built-ins are also noted in the table.

<table>
<thead>
<tr>
<th>Obsolete Menu Built-in</th>
<th>Migration Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application_Menu</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>Application_Parameter</td>
<td>No migration path or replacement functionality. See Chapter 12, &quot;Menu Parameters&quot;.</td>
</tr>
<tr>
<td>Background_Menu&lt;n&gt;</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>Debug_Mode</td>
<td>No migration path or replacement functionality. Code containing this built-in will compile but will not provide functionality.</td>
</tr>
<tr>
<td>Disable_Item</td>
<td>Use SET_MENU_ITEM_PROPERTY().</td>
</tr>
<tr>
<td>Enable_Item</td>
<td>Use SET_MENU_ITEM_PROPERTY().</td>
</tr>
<tr>
<td>Exit_Menu</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>Hide_Menu</td>
<td>No migration path or replacement functionality.</td>
</tr>
</tbody>
</table>
## Obsolete Menu Built-ins

<table>
<thead>
<tr>
<th>Obsolete Menu Built-in</th>
<th>Migration Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item Enabled</td>
<td>Use GET_MENU_ITEM_PROPERTY(&lt;name&gt;, ENABLED). Item Enabled will work in Oracle9i Forms, but will be removed in a future release.</td>
</tr>
<tr>
<td>Main_Menu</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>Menu_Clear_Field</td>
<td>Use CLEAR_ITEM.</td>
</tr>
<tr>
<td>Menu_Failure</td>
<td>Use FORM_FAILURE flag.</td>
</tr>
<tr>
<td>Menu_Help</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>Menu_Message</td>
<td>Use MESSAGE.</td>
</tr>
<tr>
<td>Menu_Next_Field</td>
<td>Use NEXT_ITEM.</td>
</tr>
<tr>
<td>Menu_Parameter</td>
<td>No migration path or replacement functionality. See Chapter 12, &quot;Menu Parameters&quot;.</td>
</tr>
<tr>
<td>Menu_Previous_Field</td>
<td>Use PREVIOUS_ITEM.</td>
</tr>
<tr>
<td>Menu_Redisplay</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>Menu_Show_Keys</td>
<td>Use SHOW KEYS. The upgrade process will make this change automatically.</td>
</tr>
<tr>
<td>Menu_Success</td>
<td>Use FORM_SUCCESS flag.</td>
</tr>
<tr>
<td>New_Application</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>New_User</td>
<td>Use LOGOUT and LOGON.</td>
</tr>
<tr>
<td>Next_Menu_Item</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>OS_Command</td>
<td>Use HOST.</td>
</tr>
<tr>
<td>OS_Command1</td>
<td>Use HOST.</td>
</tr>
<tr>
<td>Previous_Menu</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>
<td>Previous_Menu_Item</td>
<td>No migration path or replacement functionality.</td>
</tr>
<tr>

Obsolete Syntax

Using the ampersand (&) as a functional equivalent to NAME_IN() is now obsolete.
Obsolete Syntax
In order to streamline the tools available and simplify the development process for building Forms applications for the Web, triggers that are not applicable to Web deployment have been removed. In addition, the functionality of some triggers is being more strictly enforced.

**Obsolete Triggers**

**Table 5–1 Obsolete Triggers**

<table>
<thead>
<tr>
<th>Obsolete Triggers</th>
<th>Migration Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON-DISPATCH-EVENT</td>
<td>Applies only to OLE and OCX items. Therefore, no migration path or replacement functionality.</td>
</tr>
<tr>
<td>All V2-style triggers</td>
<td>When you open FMBs that contain V2-style triggers, the triggers are dropped and a warning message lists the names of the dropped triggers. You should recode V2-style triggers into PL/SQL in Forms 6i, before upgrading to 9i.</td>
</tr>
</tbody>
</table>
Stricter Enforcement of Triggers

The use of the following triggers is more strictly enforced. These triggers will not execute if they are used incorrectly.

<table>
<thead>
<tr>
<th>Trigger</th>
<th>Restricted Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>WHEN-CLEAR-BLOCK</td>
<td>Allowed at the Block and Form level only. No longer allowed at the Item level.</td>

<td></td>
</tr>
<tr>
<td>WHEN-NEW-FORM-INSTANCE</td>
<td>Allowed at the Form level only. No longer allowed at the Block and Item level.</td>
</tr>
</tbody>
</table>
In order to streamline the tools available and simplify the development process for building Forms applications for the Web, properties that are not applicable to Web deployment have been removed.

**Obsolete Properties**

Many properties, including those associated with character mode and menus, have been removed. When you open a form that contains these properties, the properties are ignored and do not appear in Forms Developer. Except as noted, code that attempts to use these properties at runtime will fail.

**Table 6–1 Obsolete Properties**

</tbody>
</table>
Changes to Client-Server Deployment and Forms Runtime

In order to streamline the tools available and simplify the development process for building Forms applications for the Web, client-server runtime is obsolete in Oracle9i Forms Developer and Forms Services, as it is not applicable to Web deployment.

If you currently deploy applications in a client-server environment and do not want to switch to Web-based deployment, you must remain on Forms6i. When you use Oracle9i Forms Developer, part of the migration process is to upgrade your Forms applications for Web-based deployment.

See Chapter 15, "Migrating Client-Server Applications to the Web" for information about how client-server deployment differs from Web-based deployment.

Effect on Forms Development

The obsolescence of client-server deployment will have little to no effect on the development and debugging of Forms applications. You can still run your code in Forms Developer without having to deploy on the Web first. Use the run-on-Web facility, which renders a true WYSIWYG representation of a Web-deployed form.

The PL/SQL debugger has been improved to allow debugging in a three-tier environment.
Obsolete Forms Runtime Command Line Options

The following command line options for Runform have been removed because they relate to obsolete features:

■ OptimizeSQL
■ OptimizeTP
■ Keyin
■ Keyout
■ Output_file
■ Interactive
■ Block_menu
■ Statistics

Obsolete Character Mode Runtime

Character mode runtime, which was only available on UNIX and VMS platforms, is no longer available. All character mode support has been removed from Oracle9i Forms Developer and Forms Services. See Chapter 6, "Properties" and Chapter 8, "Logical and GUI Attributes" for more information.
In order to streamline the tools available and simplify the development process for building Forms applications for the Web, logical and GUI attributes that are not applicable to Web deployment have been removed.

**Use Visual Attributes to Replace Logical and GUI Attributes**

For Web-deployed forms, you can use Visual Attributes in place of logical and GUI attributes to define the appearance of dynamic items.

**Obsolete Logical and GUI Attributes**

Replace any references to the following obsolete logical and GUI attributes in SET_ITEM_PROPERTY, SET_FIELD, or DISPLAY_ITEM with an equivalent Visual Attribute.

<table>

</tbody>
</table>
In order to streamline the tools available and simplify the development process for building Forms applications for the Web, item types that are not applicable to Web deployment have been removed.

**Item Types Specific to Operating Systems**

The following item types are operating-system specific and are obsolete in Oracle9i Forms Developer and Forms Services. These items are not removed by the migration process. However, any modules that contain them will not compile. Use JavaBeans and Pluggable Java Components for equivalent functionality.

<table>
<thead>
<tr>
<th>Item Type</th>
<th>Migration Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>VBX</td>
<td>Was applicable to 16-bit Windows platforms only. No migration path or replacement functionality.</td>
</tr>
<tr>
<td>OLE Container</td>
<td>Was applicable to Windows platforms only. Programmatic OLE interaction is supported with external OLE servers on the middle tier.</td>
</tr>
<tr>
<td>OCX/ActiveX Controls</td>
<td>Was applicable to Windows platforms only. JavaBean support provides similar functionality.</td>
</tr>
<tr>
<td>Sound</td>
<td>No migration path. JavaBeans can be used to provide equivalent functionality.</td>
</tr>
</tbody>
</table>
In order to streamline the tools available and simplify the development process for building Forms applications for the Web, List of Values (LOVs) that are not applicable to Web deployment have been removed.

**Obsolete List of Values (LOVs)**

LOVs based on record groups are still valid.

"Old-style" LOVs (V2.3-style LOVs) are obsolete in Oracle9i Forms.

When forms that contain old-style LOVs are migrated to Oracle9i Forms Developer, the old-style LOVs’ Old LOV Text property, which refers to a table and column (such as EMP.ENAME), is converted to a "new-style" LOV by creating a record group based on a query (select <column> from <table>). The new-style LOV is based on the new record group.
As a result of removing old-style (V2) triggers, V2 user exits have also been removed.

**Obsolete V2 User Exits**

The following user exits, which are hard-coded callbacks to V2 trigger functionality, have been removed. It is now assumed that any calls to these user exits is calling a user-defined user exit rather than an built-in one. Therefore, any code that attempts to locate them is directed to the user exit with the same name in the IAPXTB structure. (IAPXTB is a file that acts as an index to locate each of the user exits that you create at runtime.)

You should recode any code that uses these callbacks to PL/SQL:

- COPY
- ERASE
- HOST
- EXEMACRO
- EZ_GOREC
- EZ_CHKREC
In order to streamline the tools available and simplify the development process for building Forms applications for the Web, menu parameters, which are not applicable to Web deployment, have been removed.

All menu parameters will be removed from your applications when you migrate to Oracle9i Forms.

Predefined Menu Parameters

Predefined menu parameters have names like UN and PW. Using predefined menu parameters, you were able to refer to bind variables, for example, :UN and :PW in PL/SQL code attached to menu items.

When migrating to Oracle9i Forms Developer, use the recommended built-ins as replacements for the obsolete predefined menu parameters in the following table below:

<table>
<thead>
<tr>
<th>Obsolete Parameter</th>
<th>Recommended Built-in</th>
</tr>
</thead>
<tbody>
<tr>
<td>:UN</td>
<td>GET_APPLICATION_PROPERTY(USER_NAME)</td>
</tr>
<tr>
<td>:PW</td>
<td>GET_APPLICATION_PROPERTY(PASSWORD)</td>
</tr>
<tr>
<td>:LN</td>
<td>GET_APPLICATION_PROPERTY(USER_NLS_LANG)</td>
</tr>
<tr>
<td>:AD</td>
<td>GET_FORM_PROPERTY(NAME_IN('SYSTEM.CURRENT_FORM'),FILE_NAME)</td>
</tr>
<tr>
<td>:SO</td>
<td>:SYSTEM.TRIGGER_MENUOPTION</td>
</tr>
</tbody>
</table>
User-Defined Menu Parameters

User-defined menu parameters are obsolete for Oracle9i Forms. Any menu item that calls the MENU_PARAMETER or APPLICATION_PARAMETER built-ins allowed you to define values for menu parameters.

At runtime, an un-customizable Query Parameters dialog box would let you inspect or change the values of menu parameters. Built-ins associated with Query Parameter dialogs, such as TERMINATE, are obsolete as well. See Chapter 4, "Built-ins, Packages, Constants, and Syntax" for more information.

Therefore, to replace obsolete user-defined parameters, manually redefine them as Global variables (:GLOBAL). The initial value property of parameters can be emulated by initializing your replacement Global variables in your Menu startup code.

For other features, such as the dialog box that pops up using the MENU_PARAMETER built-in, there is no replacement functionality, although you can emulate this functionality by building a dialog using Forms.

### Table 12–1 Obsolete Predefined Menu Parameters

<table>
<thead>
<tr>
<th>Obsolete Parameter</th>
<th>Recommended Built-in</th>
</tr>
</thead>
<tbody>
<tr>
<td>:TT</td>
<td>Only relevant in a character mode environment. This parameter has no replacement.</td>
</tr>
</tbody>
</table>
This chapter describes migration steps to take if your Forms applications use Java-related components.

**Using oracle.ewt Classes in Pluggable Java Components**

Pluggable Java Components (PJC) and JavaBeans use classes that are part of the oracle.ewt framework. When upgrading to Oracle9i Forms, there are steps you must take to ensure equivalent functionality.

- Be sure to set the following:
  
  ```
  SET FORMS90_BUILDER_CLASSPATH=%ORACLE_HOME%\forms90\java\f90all.jar
  ```

- The Oracle9i Forms JAR files (f90all.jar and f90all_jinit.jar) only contain the ewt classes, which are required by the Forms Java Client. Therefore, PJC that had been used with Forms6i may fail at runtime in Oracle9i Forms because the classes that were available in Forms6i can no longer be located. Missing oracle.ewt classes are available in ewt.jar, which is supplied with Oracle9i JDeveloper.

- Because of security constraints related to Java 1.3, which is used by Oracle9i Forms, you must re-sign all of the classes (including the Forms classes) with your own certificate. Java 1.3 requires that all classes from the same package be signed with the same certificate. Therefore, if you need to use extra classes from ewt.jar in combination with f90all.jar, you must re-sign all of the classes with your own certificate.

- The sample PJC and JavaBeans provided by Oracle are re-coded to use Swing classes or oracle.ewt classes. The sample PJC and JavaBeans that are provided with Oracle9i Forms will not encounter this problem.
JDK Versions and Font-Rendering Issues

When migrating Forms applications from JDK 1.1 to JDK 1.3 or higher, you may encounter font height changes. This is because the code that renders fonts underwent significant changes from JDK 1.1 to JDK 1.3. As a result of these changes, the font height for logical fonts of the same size increased in JDK 1.3. For example, a dialog font of size 12 points has a height of 15 points in JDK 1.1 and a height of 17 points in JDK 1.3.

In Forms applications, the font size changes may affect labels, which can overlap text fields. One possible workaround is to set the following applet parameter to "yes":

<PARAM NAME = "mapFonts" VALUE = "yes" >

After making this change, check the appearance of the font size to be sure it is acceptable. You may still need to modify the form if this workaround does not provide acceptable font sizes. See the Oracle9iAS Forms Services Deployment Guide for details.
Oracle Graphics6i is no longer shipped with Oracle9i Forms. In addition, the Charting wizard has been removed from Forms. This chapter describes how you can call existing Graphics6i and Reports applications from a form.

**Oracle Graphics6i**

You cannot create new charts because Oracle Graphics6i is no longer shipped with Oracle9i Forms. However, you can display existing charts in Forms applications that have been migrated.

**Note:** If your forms use the Graphics Web Cartridge or Oracle Graphics6i Runtime to display Graphics6i objects, you should remain on Forms6i. The Graphics Web Cartridge was supported in the Forms 6i base release and Oracle Application Server (OAS) 4.0.8.2. OAS 4.0.8.2 is no longer supported. Forms6i Release 2 (released as part of Oracle9iAS 1.0.2.1) did not support the Graphics Web Cartridge. The recommendation for users using Graphics on the Web was to use Graphics embedded in Reports6i. Reports6i was enhanced to support dynamic Graphics so that it was possible to bring interactive charts to the Web without using the Graphics Web Cartridge. A whitepaper available at http://otn.oracle.com describes Graphics/Reports integration.
Displaying Existing Charts in Oracle9i Forms

If your form contains embedded Oracle Graphics6i displays, you can migrate the form to Oracle9i Forms by doing the following:

- Use the RUN_PRODUCT call, or display the Oracle Graphics6i chart as a chart object.
- Be sure that Oracle Graphics6i is installed on the same machine as Oracle9i Forms Services, but in a separate ORACLE_HOME, for example, OG6I_HOME.
- On Windows, set the registry variable ORACLE_GRAPHICS6I_HOME to the ORACLE_HOME directory where Graphics6i is installed. This variable must be set in the registry key that contains other Oracle9i Forms registry variables. The version of Graphics6i must include patch 6 or higher.
- On Solaris, set the environment variable ORACLE_GRAPHICS6I_HOME to the ORACLE_HOME directory where Graphics6i is installed. The version of Graphics6i must include patch 6 or higher.
- If you use OG.PLL to run Graphics6i, then you must open and compile OG.PLL in Oracle9i Forms Developer before you can use it.
- Set the path definition in the Forms servlet environment to include Graphics as follows:
  ```
  PATH=%FORMS9I_HOME%\bin;%ORACLE_GRAPHICS6I_HOME%\bin;
  ```

**Note:** The following registry entries are read directly from the Forms6i ORACLE_HOME registry:

- GRAPHICS60 = %ORACLE_HOME%\TOOLS\DBTAB60\GRAPH60
- DE60 = %OG6I_HOME%\TOOLS\COMMON60
- GRAPHOGD60 = %ORACLE_HOME%\TOOLS\DBTAB60\GRAPH60\GWIZ_OGD
- MM60 = %OG6I_HOME%\TOOLS\COMMON60
- TK60 = %OG6I_HOME%\TOOLS\COMMON60

Editing Existing Chart Items

You can edit the properties of existing chart items, create new chart items in Oracle9i Forms Developer, and populate a chart item with an OGD file that was created in Oracle Graphics6i Developer. However, future releases of Forms may further restrict Graphics6i functionality.

Oracle Reports

You can embed new and existing Reports applications in forms that have been migrated to Oracle9i Forms.

You can no longer use the Reports client runtime engine to output Reports in the Web. From Forms50 forward, the RUN_REPORT_OBJECT built-in is available in Forms Developer to run integrated reporting in Forms. The Run_Product built-in is obsolete in Oracle9i Forms for running Oracle Reports applications from Forms. Oracle9i Forms and Oracle9i Reports are now Web-based only, and do not have client/server runtime engines. Therefore, integrated reports in Oracle9i Forms applications must be recoded to use the RUN_REPORT_OBJECT built-in and Reports Services.

Displaying Reports in Oracle9i Forms

If your form contains embedded Oracle Reports applications, you can migrate the form to Oracle9i Forms by changing the integrated call to Oracle Reports to use:

- RUN_REPORT_OBJECT built-in (Do not use the Run_Product built-in to call Reports.)
- WEB.SHOW_DOCUMENT built-in

Using Run_Product in Forms to run integrated Oracle Reports is no longer supported in Oracle9i Forms. The Oracle9i Forms Migration Assistant is provided to help you migrate your applications to use Run_Report_Object. See Chapter 2, "Using the Oracle9i Forms Migration Assistant" for more information.

Example

The following example runs a report using the RUN_REPORT_OBJECT built-in. The report_object node defined in Forms Developer is assumed to be "report_node1". A user-defined Reports parameter "p_deptno" is passed by Forms using the value in the "dept.deptno" field. The Reports parameter form is suppressed. For
additional details about the logic used in this example, see Notes About the Example.

/* The following example runs a report using the RUN_REPORT_OBJECT built-in. The report_object node defined in Forms Developer is assumed to be "report_node1". A user-defined Reports parameter "p_deptno" is passed by Forms using the value in the "dept.deptno" field. The Reports parameter form is suppressed */

DECLARE
  v_report_id Report_Object;
  vc_report_job_id VARCHAR2(100); /* unique id for each Report request */
  vc_rep_status VARCHAR2(100); /* status of the Report job */
BEGIN
  /* Get a handle to the Report Object itself. */
  v_report_id := FIND_REPORT_OBJECT('report_node1');
  SET_REPORT_OBJECT_PROPERTY(v_report_id, REPORT_COMM_MODE, SYNCHRONOUS);
  SET_REPORT_OBJECT_PROPERTY(v_report_id, REPORT_DESTYPE, CACHE);

  /* Define the Report output format and the name of the Reports Server as well as a user-defined parameter, passing the department number from Forms to the Report. The Reports parameter form is suppressed by setting paramform to "no". */
  SET_REPORT_OBJECT_PROPERTY(v_report_id, REPORT_DESFORMAT, '<HTML|HTMLCSS|PDF|RTF|XML|DELIMITED>');
  /* replace <ReportServerTnsName> with the name of the Reports9i Services as defined in your tnsnames.ora file */
  SET_REPORT_OBJECT_PROPERTY(v_report_id, REPORT_SERVER, '<ReportServerTnsName>');
  SET_REPORT_OBJECT_PROPERTY(v_report_id, REPORT_OTHER, 'p_deptno='||:dept.deptno||'paramform=no');
  /* finally, run the report and retrieve the Reports job_id as a handle to the Reports process */
  vc_report_job_id := RUN_REPORT_OBJECT(report_id);

  /* The report output is not delivered automatically to the client, which is okay because the Web is a request model. Thus the next step is to check if the report finished. */

  vc_rep_status := REPORT_OBJECT_STATUS(vc_report_job_id);
  IF vc_rep_status = 'FINISHED' THEN
    /* Call the Report output to be displayed in a separate browser window. The URL for relative addressing is only valid when the Reports Server is on the same host as the Forms Server. For accessing a Remote Reports Server on a different machine, you must use the prefix http://hostname:port */
    web.show_document (':/<virtual path>/<reports cgi or servlet name>/getjobid='||
vc_report_job_id || '?server=' || '<ReportServerTnsName>', '_blank');
ELSE
message ('Report failed with error message ' || rep_status);
END IF;
END;

Notes About the Example

- Calling a report synchronously makes the user wait while the report gets processed on the server. For long-running Reports, it is recommended that you start the Report asynchronously, by setting the REPORT_COMM_MODE property to asynchronous and the REPORT_EXECUTION_MODE to batch.

```
SET_REPORT_OBJECT_PROPERTY(report_id, REPORT_EXECUTION_MODE, BATCH);
SET_REPORT_OBJECT_PROPERTY(report_id, REPORT_COMM_MODE, ASYNCHRONOUS);
```

- After calling the RUN_REPORT_OBJECT built-in, you must create a timer to run frequent checks on the current REPORT_OBJECT_STATUS using a When-Timer-Expired trigger. For performance reasons, the timer should not fire more than four times a minute. After the report is generated, the When-Timer-Expired trigger calls the WEB.SHOW_DOCUMENT built-in to load the Reports output file, identified by a unique job_id, to the client’s browser.

**Note:** Do not forget to delete the timer when it is no longer needed.

The following example shows the When-Timer-Expired trigger that checks for the Report_Object_Status.

```

/* :global.vc_report_job_id needs to be global because the information about the Report job_id is shared between the trigger code that starts the Report and the When-Trigger-Expired trigger that checks the current Report status. */
vc_rep_status:= REPORT_OBJECT_STATUS(:global.vc_report_job_id);
IF vc_rep_status='FINISHED' THEN
web.show_document ('/<virtual path>/<reports cgi or servlet name>/getjobid=' || vc_report_job_id || '?server=' ||
'<ReportServerTnsName>', '_blank');
ELSIF vc_rep_status not in ('RUNNING', 'OPENING_REPORT', 'ENQUEUED') THEN
message (vc_rep_status || ' Report output aborted');
END IF;

(...)
```
Using Parameter Lists in RUN_REPORT_OBJECT

Parameter lists that were used with RUN_PRODUCT in client-server mode can also be used with RUN_REPORT_OBJECT calling Reports Services. System parameters must be set by the Set_Report_Object_Property. The syntax for using parameter lists in RUN_REPORT_OBJECT is as follows:

```
report_job_id:=run_report_object(report_id,paramlist_id);
```

where paramlist_id is the same id used with RUN_PRODUCT.

Parameter settings can be any of the following:

- **REPORT_COMM_MODE**: Batch, Runtime
- **REPORT_EXECUTION_MODE**: Synchronous, Asynchronous
- **REPORT_DESTYPE**: File, Printer, Mail, Cache
- **REPORT_FILENAME**: The report filename (not used with CACHE)
- **REPORT_DESNANE**: The report destination name (not used with Cache)
- **REPORT_DESFORMAT**: The report destination format
- **REPORT_SERVER**: The report server name

Other settings are as follows:

- Reports9i CGI name is "rwcgi90" (UNIX) and "rwcgi90.exe" (Windows NT)
- Reports Servlet default name is "rwservlet"
- Reports Servlet virtual path is /reports/

Migration Steps

You can use the Oracle9i Forms Migration Assistant described in Chapter 2, "Using the Oracle9i Forms Migration Assistant" to change integrated Reports calls in your Oracle9i Forms modules. The Oracle9i Forms Migration Assistant adds code to your application modules that redirects Run_Product calls to Reports and uses the Run_Report_Object built-in and Reports Services. The resulting conversion is of the same quality as using Run_Product and the runtime engine in Forms6i.

To manually migrate Reports in Forms, do the following:

1. Find all occurrences of Run_Product.
2. Identify and locate the parameter lists used with these calls.
3. Remove all of the Reports system parameter settings like desname and destype from the parameter lists.

4. Find the Reports node ID for the Reports node name defined in Oracle9i Forms Developer or the Forms6i Builder.

5. Create Set_Report_Object_Property codes for DESNAME, REPORT_SERVER, DESFORMAT, DESTYPE, COMM_MODE, and EXECUTION:MODE in your PL/SQL.

6. Use Run_Report_Object(report_node_id, paramlist_id) to reuse your parameter lists that had been created for Run_Product.

**Note:** Detailed information about how to change calls to Oracle Reports in Forms 6i to use Run_Report_Object are provided in a whitepaper on http://otn.oracle.com.
If you are currently using the client-server version of Forms Server, migrating applications to Forms Services for the Web is straightforward. This chapter briefly describes the differences between client-server and Web implementations, and then gives guidelines to migrate your current applications from client-server-based to Web-based Forms Services. In addition, you will find white papers and other resources at http://otn.oracle.com.
Client-Server-Based Architecture

In the client-server-based implementation, shown in Figure 15–1, the Forms Server Runtime Engine and all application logic are installed on the user’s desktop machine. All user interface and trigger processing occurs on the client, except for database-server-side triggers and logic that may be included in some applications.

Figure 15–1 Legacy Forms Server client-server-based architecture
Web-Based Architecture

In a Web-based implementation, shown in Figure 15–2, the Forms Services Runtime Engine and all application logic are installed on application servers, and not on client machines. All trigger processing occurs on the database and application servers, while user interface processing occurs on the Forms client, located on users’ machines.

Figure 15–2 Forms Services Web-based architecture
Who Should Read this Chapter?

This chapter will be useful to you if the following statements apply to your deployment environment:

- You currently deploy Web-based Forms Developer applications.
- You use Oracle Application Server for Web server support.

Guidelines for Migration

When migrating your applications from client-server deployment to the Web, note that a Web-based application:

- Supports JPEG and GIF image types only, so convert existing images to these formats.
- Supports the use of compressed JAR (Java Archive) files for file transfer, so use JAR files whenever the transfer of large files is required between the Forms Services and the Java client.
- Does not support ActiveX, OCX, OLE, or VBX controls in the user interface. Instead, use JavaBeans to duplicate functionality in the user interface. Any other Microsoft Windows user interface dependencies should also be replaced with JavaBeans.
- Does not support MouseMove triggers, such as When-Mouse-Enter, When-Mouse-Leave, and When-Mouse-Move.
- Does not natively support write access to the client hard drive. This can be accomplished by writing a JavaBean for the pluggable Forms user interface.
- Supports Java fonts only, so check applications for the types of fonts used. If necessary, switch to Java fonts. Java uses a font alias list, located in the Registry.dat file. The font aliases described in Table 15–1 are supported:

<table>
<thead>
<tr>
<th>Java font</th>
<th>Windows font</th>
<th>XWindows font</th>
<th>Macintosh font</th>
</tr>
</thead>
<tbody>
<tr>
<td>Courier</td>
<td>Courier New</td>
<td>adobe-courier</td>
<td>Courier</td>

</tr>
</tbody>
</table>
About Upgrading Forms

Forms Developer is upwardly compatible with earlier versions of Oracle Forms, including Versions 3.0, 4.0, 4.5, and 5.0.

Note: If you are migrating from older releases of Forms to Oracle9i Forms, you must first migrate your applications to Forms6i, and then migrate them to Oracle9i Forms.

Note: Before converting your forms or menus, it is recommended that you first make backup copies of all files. Once you upgrade a module, you will not be able to open it in an earlier version of Forms Developer.

Upgrading a Form

To upgrade a version 4.x or 5.x Forms application to Forms6i:

1. Start Forms6i.
2. Choose File | Open to display the file or database dialog.
3. Choose the module you want to upgrade.
4. Click OK.
5. Choose File | Save.
6. Choose Program | Compile | All to compile the newly-upgraded module.

Note: You can also use the Forms compiler (f60genm and ifcmp60) to upgrade a Forms application to 6i.

Note: All form modules and libraries must be upgraded and recompiled.
To upgrade a pre-4.0 Forms application to Forms6i:

To upgrade a pre-4.0 form to Forms6i, first upgrade the form to version 4.5 (using Forms 4.5 to perform the upgrade), and then upgrade from version 4.5 to version 6i according to the instructions above.

To upgrade a pre-4.0 form to version 4.5, type this statement at the command line, substituting the correct form of the Forms 4.5 Generate command for your environment:

```
f45gen32 <module_name> <username>/<password> upgrade=yes version=<version_number>
```

### Table 16–1 Version Number for Forms 4.5 Generate Command

<table>
<thead>
<tr>
<th>To upgrade from</th>
<th>Use this version number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version 3.0</td>
<td>30</td>
</tr>
<tr>
<td>Version 2.3</td>
<td>23</td>
</tr>
<tr>
<td>Version 2.0</td>
<td>20</td>
</tr>
</tbody>
</table>

### PL/SQL 9 Support

Stored program units can use all the new PL/SQL 9 features.

### Compatibility with Earlier Versions of PL/SQL

If you have client-side program units written in PL/SQL V1 or V2, you must convert that code to the new level. The PL/SQL V1 conversion utility is provided to help automate the upgrading process.

Stored program units written in PL/SQL V2 will run against the PL/SQL V9 engine on the database server, but may compile with errors. These errors arise in some situations where there is syntax incompatibility between V2 and V9. A V2 compatibility flag in V9 database enables you to choose a V2 compatibility mode, so that the V9 engine does not issue such errors when it compiles V2 code.
Forms Developer Runtime Behavior

The default runtime behavior of forms created with Forms 5.0 through 6i differed from runtime behavior for Forms 4.5. The form-level Runtime Compatibility Mode property could be set to "4.5" to provide Forms release 4.5 behavior. (This happened by default in forms that were upgraded from Forms release 4.5.)

Starting with Oracle9i Forms Developer, 5.0 behavior is used in all cases, and the form-level property, Runtime Compatibility Mode is ignored.

If you are upgrading a form that specifies 4.5 behavior to Oracle9i Forms, you must alter the logic, as necessary, to reflect the differences between 4.5 and 5.0 behavior. See the Forms6i online help for information about the Runtime Compatibility Mode property and the differences between 4.5 and 5.0 behavior.
