Union Investment Improves Applications Performance with Efficient Implementation of Web-Based Front End Application

With over 50 years of experience, Union Investment, and its 2,370 employees develop and provide asset management solutions for private and institutional investors. Today, Union Investment is one of Germany's largest asset managers, having €177.4 billion worth of assets under its management. More than 4.5 million customers entrust their assets to Union Investment in over 950 funds.

Challenges and Solutions

For Union Investment, the demands of existing pooled interfaces as well as ensuring application maintenance and performance made it necessary to implement a new front end. The company migrated using Oracle Application Express, producing a front end that was Web-based, high-performing, scalable, and sustainable, as well as cost effective, in the total cost of ownership.

The application enables consolidating data in the data warehouse that supports internal reporting. The migrated environment also eliminated application performance issues. Additionally, wizards quickly produced 80% of the application screens, which reduces time and costs, compared to manual implementation. The application is also easy to maintain and rollout is easily accomplished through a uniform resource locator.
