Oracle’s Agile Product Governance and Compliance enables organizations to manage the compliance of their products and programs with government and industry standards and regulations. The solution merges compliance activities with the enterprise product record, allowing companies to more-reliably comply with environmental standards, create policy documentation, and design green or compliant products from the start—reducing the risk of costly business interruption or shutdown.

The Challenges of Ensuring Compliance

Increasing regulation is a trend in the life sciences, automotive, and high-technology industries that can slow time to market or—when compliance is not achieved—derail the product lifecycle altogether. Companies and products must comply with a multitude of standards, regulations, and due diligence requirements, including:

- Corporate standards such as those set by the International Organization for Standardization (ISO 9000, 14000, 13485)
- Environmental and safety regulations such as those set by the U.S. Food and Drug Administration (FDA)
- Industry-specific regulations such as those set by the U.S. Securities and Exchange Commission (SEC) or the U.S. Department of Defense (DoD)

Periodic audits by these regulatory bodies and customers mean product lifecycle processes must be transparent and audit ready.

Companies need a solution that links all product governance and compliance data and processes in a single database with enterprise-wide visibility. Agile Product Governance and Compliance manages compliance within the enterprise product record—the complete, up-to-the-minute definition of the product. Its core functionalities track and maintain full compliance by linking critical steps in the product lifecycle with processes that ensure standards and regulations are met.

Agile Product Governance and Compliance Overview

Companies that cannot manage product compliance across the range of regulatory bodies suffer costly business interruptions such as product redesigns, delayed market launches, product returns, recalls, FDA citation, or even disastrous business shutdown. In conjunction with Oracle’s Agile Product Collaboration, Agile Product Governance and Compliance enables companies to transform their reactive, manual compliance processes into a repeatable, audit-ready system that reduces the risk of
business interruption, and restores a favorable risk/return product profile.

By integrating the product record with government and industry regulations and standards, Agile Product Governance and Compliance allows companies to manage product policies and operations within a system that has built-in compliance support. Agile Product Governance and Compliance offers the following core functionalities.

**Oversight of Compliance Processes**

When users and managers conduct internal and external audits, management reviews, and closed-loop continuous improvement processes, the system prompts them to validate or correct critical governance and compliance processes. Proper procedures can be managed, measured, and communicated automatically to the appropriate personnel to maintain continuous compliance and address failure points.

**Environmental Compliance**

Manufacturing companies, particularly electronics producers, are challenged to comply with European Union and other global directives regarding hazardous materials—including the Restriction of Hazardous Substances Directive (RoHS) and the Waste Electrical and Electronic Equipment Directive (WEEE). The environmental compliance functionality allows manufacturers to collect information about resources, substances, materials, and components used in the production of a product, as well as the waste that was generated to manufacture the product, perform related risk analysis, and supply reports to customers or regulatory agencies. Material declarations and certificates of compliance are collected and stored in a central database. This database can be further enriched with content from reliable industry sources or third-party databases.

The information in this database is then used to validate compliance with legislation, internal requirements or customer specifications that enable product teams to detect when a product is out of compliance—such as when legislation changes, when the materials and components in a product change, or when the product’s supply chain changes. Detecting such critical issues early allows the team to bring the product back into compliance without costly delays and disastrous product recalls.

**Design for Environment**

The design for environment functionality improves the process of designing new products. It guides designers to build products that satisfy environmental regulations from the initial concept phase by integrating the product record with limits set by government standards and regulations. Design teams can analyze new product designs for environmental compliance, and environmental performance and conduct what-if analysis to ensure they meet environmental requirements at all levels—including environmental protections that regulate business, technical attributes, and operations in specific countries.

**Government and Industry Compliance**

Companies must comply with their own operating procedures as well as with the standards and regulations of such entities as ISO, DoD, and the FDA. Compliance managers create and maintain the documentation that specifies policies and
Agile Product Lifecycle Management helps companies accelerate revenue, reduce costs, improve quality, ensure compliance, and drive innovation throughout the product lifecycle. With a broad suite of best practice, enterprise-class product lifecycle management solutions, Oracle helps you get the most from your products.
