The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

**U.S. GOVERNMENT RIGHTS**

Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are “commercial computer software” or “commercial technical data” pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle Corporation, 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee’s responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

Glossary of PeopleSoft Enterprise Terms...............................................245

Index .......................................................................................................271
About This PeopleBook

PeopleSoft Enterprise PeopleBooks provide you with the information that you need to implement and use PeopleSoft Enterprise applications from Oracle.

This preface discusses:

• PeopleSoft Enterprise application prerequisites.
• Application fundamentals.
• Documentation updates and printed documentation.
• Additional resources.
• Typographical conventions and visual cues.
• Comments and suggestions.
• Common elements in PeopleBooks.

Note. PeopleBooks document only elements, such as fields and check boxes, that require additional explanation. If an element is not documented with the process or task in which it is used, then either it requires no additional explanation or it is documented with common elements for the section, chapter, PeopleBook, or product line. Elements that are common to all PeopleSoft Enterprise applications are defined in this preface.

PeopleSoft Enterprise Application Prerequisites

To benefit fully from the information that is covered in these books, you should have a basic understanding of how to use PeopleSoft Enterprise applications.

You might also want to complete at least one introductory training course, if applicable.

You should be familiar with navigating the system and adding, updating, and deleting information by using PeopleSoft Enterprise menus, pages, or windows. You should also be comfortable using the World Wide Web and the Microsoft Windows or Windows NT graphical user interface.

These books do not review navigation and other basics. They present the information that you need to use the system and implement your PeopleSoft Enterprise applications most effectively.

Application Fundamentals

Each application PeopleBook provides implementation and processing information for your PeopleSoft Enterprise applications.

For some applications, additional, essential information describing the setup and design of your system appears in a companion volume of documentation called the application fundamentals PeopleBook. Most product lines have a version of the application fundamentals PeopleBook. The preface of each PeopleBook identifies the application fundamentals PeopleBooks that are associated with that PeopleBook.
The application fundamentals PeopleBook consists of important topics that apply to many or all PeopleSoft Enterprise applications. Whether you are implementing a single application, some combination of applications within the product line, or the entire product line, you should be familiar with the contents of the appropriate application fundamentals PeopleBooks. They provide the starting points for fundamental implementation tasks.

**Documentation Updates and Printed Documentation**

This section discusses how to:

- Obtain documentation updates.
- Download and order printed documentation.

**Obtaining Documentation Updates**

You can find updates and additional documentation for this release, as well as previous releases, on Oracle’s PeopleSoft Customer Connection website. Through the Documentation section of Oracle’s PeopleSoft Customer Connection, you can download files to add to your PeopleBooks Library. You’ll find a variety of useful and timely materials, including updates to the full line of PeopleSoft Enterprise documentation that is delivered on your PeopleBooks CD-ROM.

**Important!** Before you upgrade, you must check Oracle’s PeopleSoft Customer Connection for updates to the upgrade instructions. Oracle continually posts updates as the upgrade process is refined.

**See Also**

Oracle’s PeopleSoft Customer Connection, [http://www.oracle.com/support/support_peoplesoft.html](http://www.oracle.com/support/support_peoplesoft.html)

**Downloading and Ordering Printed Documentation**

In addition to the complete line of documentation that is delivered on your PeopleBook CD-ROM, Oracle makes PeopleSoft Enterprise documentation available to you via Oracle’s website. You can:

- Download PDF files.
- Order printed, bound volumes.

**Downloading PDF Files**

You can download PDF versions of PeopleSoft Enterprise documentation online via the Oracle Technology Network. Oracle makes these PDF files available online for each major release shortly after the software is shipped.

**Ordering Printed, Bound Volumes**

You can order printed, bound volumes of selected documentation via the Oracle Store.

**Additional Resources**

The following resources are located on Oracle’s PeopleSoft Customer Connection website:

<table>
<thead>
<tr>
<th>Resource</th>
<th>Navigation</th>
</tr>

</tbody>
</table>
### Typographical Conventions and Visual Cues

This section discusses:

- Typographical conventions.
- Visual cues.
- Country, region, and industry identifiers.
- Currency codes.

### Typographical Conventions

This table contains the typographical conventions that are used in PeopleBooks:

<table>
<thead>
<tr>
<th>Typographical Convention or Visual Cue</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bold</strong></td>
<td>Indicates PeopleCode function names, business function names, event names, system function names, method names, language constructs, and PeopleCode reserved words that must be included literally in the function call.</td>
</tr>
<tr>
<td><strong>Italics</strong></td>
<td>Indicates field values, emphasis, and PeopleSoft Enterprise or other book-length publication titles. In PeopleCode syntax, italic items are placeholders for arguments that your program must supply. We also use italics when we refer to words as words or letters as letters, as in the following: Enter the letter O.</td>
</tr>
<tr>
<td><strong>KEY+KEY</strong></td>
<td>Indicates a key combination action. For example, a plus sign (+) between keys means that you must hold down the first key while you press the second key. For ALT+W, hold down the ALT key while you press the W key.</td>
</tr>
<tr>
<td><strong>Monospace font</strong></td>
<td>Indicates a PeopleCode program or other code example.</td>
</tr>
<tr>
<td>“ ” (quotation marks)</td>
<td>Indicate chapter titles in cross-references and words that are used differently from their intended meanings.</td>
</tr>
<tr>
<td>. . . (ellipses)</td>
<td>Indicate that the preceding item or series can be repeated any number of times in PeopleCode syntax.</td>
</tr>
<tr>
<td>{ } (curly braces)</td>
<td>Indicate a choice between two options in PeopleCode syntax. Options are separated by a pipe (</td>
</tr>
</tbody>
</table>
Typographical Convention or Visual Cue | Description
---|---
[] (square brackets) | Indicate optional items in PeopleCode syntax.
&) (ampersand) | When placed before a parameter in PeopleCode syntax, an ampersand indicates that the parameter is an already instantiated object. Ampersands also precede all PeopleCode variables.

**Visual Cues**

PeopleBooks contain the following visual cues.

**Notes**

Notes indicate information that you should pay particular attention to as you work with the PeopleSoft Enterprise system.

*Note.* Example of a note.

If the note is preceded by *Important!*, the note is crucial and includes information that concerns what you must do for the system to function properly.

*Important!* Example of an important note.

**Warnings**

Warnings indicate crucial configuration considerations. Pay close attention to warning messages.

*Warning!* Example of a warning.

**Cross-References**

PeopleBooks provide cross-references either under the heading “See Also” or on a separate line preceded by the word *See*. Cross-references lead to other documentation that is pertinent to the immediately preceding documentation.

**Country, Region, and Industry Identifiers**

Information that applies only to a specific country, region, or industry is preceded by a standard identifier in parentheses. This identifier typically appears at the beginning of a section heading, but it may also appear at the beginning of a note or other text.

Example of a country-specific heading: “(FRA) Hiring an Employee”

Example of a region-specific heading: “(Latin America) Setting Up Depreciation”

**Country Identifiers**

Countries are identified with the International Organization for Standardization (ISO) country code.
Region Identifiers
Regions are identified by the region name. The following region identifiers may appear in PeopleBooks:

- Asia Pacific
- Europe
- Latin America
- North America

Industry Identifiers
Industries are identified by the industry name or by an abbreviation for that industry. The following industry identifiers may appear in PeopleBooks:

- USF (U.S. Federal)
- E&G (Education and Government)

Currency Codes
Monetary amounts are identified by the ISO currency code.

Comments and Suggestions
Your comments are important to us. We encourage you to tell us what you like, or what you would like to see changed about PeopleBooks and other Oracle reference and training materials. Please send your suggestions to your product line documentation manager at Oracle Corporation, 500 Oracle Parkway, Redwood Shores, CA 94065, U.S.A. Or email us at appsdoc@us.oracle.com.

While we cannot guarantee to answer every email message, we will pay careful attention to your comments and suggestions.

Common Elements Used in PeopleBooks

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>As of Date</td>
<td>The last date for which a report or process includes data.</td>
</tr>
<tr>
<td>Business Unit</td>
<td>An ID that represents a high-level organization of business information. You can use a business</td>
</tr>
<tr>
<td></td>
<td>unit to define regional or departmental units within a larger organization.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter up to 30 characters of text.</td>
</tr>
<tr>
<td>Effective Date</td>
<td>The date on which a table row becomes effective; the date that an action begins. For example, to</td>
</tr>
<tr>
<td></td>
<td>close out a ledger on June 30, the effective date for the ledger closing would be July 1. This</td>
</tr>
<tr>
<td></td>
<td>date also determines when you can view and change the information. Pages or panels and batch</td>
</tr>
<tr>
<td></td>
<td>processes that use the information use the current row.</td>
</tr>
</tbody>
</table>
Once, Always, and Don’t Run
Select Once to run the request the next time the batch process runs. After the batch process runs, the process frequency is automatically set to Don’t Run.
Select Always to run the request every time the batch process runs.
Select Don’t Run to ignore the request when the batch process runs.

Process Monitor
Click to access the Process List page, where you can view the status of submitted process requests.

Report Manager
Click to access the Report List page, where you can view report content, check the status of a report, and see content detail messages (which show you a description of the report and the distribution list).

Request ID
An ID that represents a set of selection criteria for a report or process.

Run
Click to access the Process Scheduler request page, where you can specify the location where a process or job runs and the process output format.

SetID
An ID that represents a set of control table information, or TableSets. TableSets enable you to share control table information and processing options among business units. The goal is to minimize redundant data and system maintenance tasks. When you assign a setID to a record group in a business unit, you indicate that all of the tables in the record group are shared between that business unit and any other business unit that also assigns that setID to that record group. For example, you can define a group of common job codes that are shared between several business units. Each business unit that shares the job codes is assigned the same setID for that record group.

Short Description
Enter up to 15 characters of text.

User ID
An ID that represents the person who generates a transaction.
Security Administration Preface

This preface provides an overview of the content discussed in the Security Administration PeopleBook.

Security Administration

This PeopleBook covers a wide range of different tools and techniques for administering security on your PeopleSoft system, including:

- Permission lists.
- Roles
- User profiles.
- Digital certificates and single signon.
- Pluggable cryptography.
- Query and definition security.
- Personalization features.

Note. Remember that your application documentation also contains security topics that are more specific to the applications you’ve purchased.
CHAPTER 1

Getting Started with Security Administration

This chapter provides overviews of security administration and security administration integrations and discusses security administration implementation.

Security Administration Overview

This section discusses:

• User security.
• Lightweight Directory Access Protocol (LDAP).
• Authentication and single signon.
• Pluggable cryptography.
• Query and definition security.
• PeopleSoft personalizations.

User Security

User security is the core of security administration in PeopleSoft applications. You administer user security using several basic elements.

To establish appropriate user access:

1. Define permission lists.

   *Permission lists* are the building blocks of user security authorization. A permission list grants a degree of access to a particular combination of PeopleSoft elements, specifying pages, development environments, time periods, administrative tools, personalizations, and so on.

   This level of access should be appropriate to a narrowly defined and limited set of tasks, which can apply to a variety of users with a variety of different roles. These users might have overlapping, but not identical, access requirements.

   You typically define permission lists before you define roles and user profiles. When defining permission lists, however, consider the roles that you will use them with.

2. Define roles.

   A *role* is a collection of permission lists. You can assign one or more permission lists to a role. The resulting combination of permissions can apply to all users who share those access requirements. However, the same group of users might also have other access requirements that they don’t share with each other. You can assign a given permission list to multiple roles.
You typically define roles after first defining their permission lists, and before defining user profiles. You use roles to assign permissions to users dynamically.

3. Define user profiles.

A user profile is a definition that represents one PeopleSoft user. Each user is unique; the user profile specifies a number of user attributes, including one or more assigned roles. Each role that’s assigned to a given user profile adds its permission lists to the total that apply to that user.

You typically define user profiles after defining their roles. You can assign a given role to multiple user profiles. It’s worthwhile to define a set of roles that you’re confident can be assigned to user profiles that you’ll create in the future.

**LDAP**

LDAP is an internet protocol used to access a directory listing. Organizations typically store user profiles in a central repository, or directory server, that serves user information for all of the programs that require it. If your existing computer network uses an LDAP V3 compliant directory server, PeopleSoft supports the use of that server for managing user profiles and authenticating users. PeopleSoft enables you to integrate your authentication scheme for PeopleSoft with your existing infrastructure.

You always maintain permission lists and roles using PeopleSoft security. However, you can maintain user profiles in PeopleSoft security or reuse user profiles and roles that are already defined within an LDAP directory server. A directory server enables you to maintain a single, centralized user profile that you can use across all of your PeopleSoft and non-PeopleSoft applications. This approach reduces redundant maintenance of user information stored separately throughout your enterprise, and reduces the possibility of user information getting out of synchronization.

You can configure and extend your signon PeopleCode to work with any schema implemented in your directory server. You can assign roles to users manually or assign them dynamically. When assigning roles dynamically, you use PeopleCode, LDAP, and PeopleSoft Query rules to assign user profiles to roles programmatically.

**Authentication and Single Signon**

PeopleSoft delivers the most common authentication solutions and packages them with your PeopleSoft application. This saves you the trouble of developing your own solutions and saves you time with your security implementation. These prepackaged solutions include PeopleCode that supports basic sign-in through secure sockets layer (SSL), LDAP authentication, and single signon.

Because PeopleSoft applications are designed for internet deployment, many sites must take advantage of the authentication services that exist at the web server level. PeopleSoft takes advantage of HTTPS, SSL, and digital certificates to secure the transmission of data from the web server to an end user’s web browser and also to secure the transmission of data between PeopleSoft servers and third-party servers (for business-to-business processing) over the internet.

PeopleSoft supports single signon within PeopleSoft applications. Within the context of your PeopleSoft system, single signon means that after a user has been authenticated by one PeopleSoft application server, that user can access a second PeopleSoft application server without entering an ID or a password. Although the user is actually accessing different applications and databases, the user navigates seamlessly through the system. Recall that each suite of PeopleSoft applications, such as HCM or CRM, resides in its own database.
PeopleSoft also supports single signon between PeopleSoft and Oracle applications. A user can signon to
either system and freely access the other without having to signon to the second system.

Single Signon,” page 139.

Pluggable Cryptography

Data security comprises the following elements:

• Privacy — keeping data hidden from unauthorized parties.
  Privacy is normally implemented with some type of encryption. Encryption is the scrambling of information
  such that no one can read it unless they have a piece of data known as a key.

• Integrity — keeping transmitted data intact.
  Integrity can be accomplished with simple checksums or, better, with more complex cryptographic
  checksums known as one-way hashes, and often with digital signatures as well.

• Authentication — verifying the identity of an entity that’s transferring data.
  Authentication can be accomplished using passwords, or with digital signatures, which are by far the most
  popular and most reliable method of authentication.

PeopleSoft pluggable encryption technology (PET) provides a way for you to use hashes and digital signatures
to secure critical PeopleSoft data and communicate securely with other businesses. It enables you to extend
and improve cryptographic support for your data in PeopleTools, giving you strong cryptography with the
flexibility to change and grow, by incrementally acquiring stronger and more diverse algorithms for encrypting
data. PeopleSoft delivers PET with support for the OpenSSL and PGP encryption libraries.

To implement pluggable cryptography:

1. Load an encryption library’s algorithms into the PET database.
2. Generate accompanying encryption keys, and insert them into the PET keystore.
3. Define a sequence, or chain of algorithms by selecting from all the algorithms in the database.
4. Define an encryption profile, which is an instance of an algorithm chain applicable to a specific
   encryption task.
5. Write PeopleCode to invoke the encryption profile.

Note. Along with the delivered OpenSSL and PGP encryption libraries, a PeopleSoft database may also
contain encryption keys for internal use of the PeopleCode Crypt class. These encryption keys do not need to
be modified.

Query and Definition Security

You use PeopleSoft Query to build SQL queries and retrieve information from application tables. For each
PeopleSoft Query user, you can specify the records the user is allowed to access when building and running
queries. You do this by creating query access groups in PeopleSoft Tree Manager, and then assigning users
to those groups with PeopleSoft Query security. PeopleSoft Query security is enforced only when using
PeopleSoft Query; it doesn’t control runtime page access to table data.
Use Definition Security to govern access to database object definitions, such as record definitions, field definitions, and page definitions, and to protect particular object definitions from being modified by developers.

PeopleSoft Personalizations

PeopleSoft offers a variety of options that enable end users, especially power users, to configure certain aspects of their PeopleSoft environment to produce a more personalized interface. These options improve a user’s navigation speed through the system and enable users to select international preferences, such as date and time formats.

You define, group, and categorize personalization options, then use permission lists to control access to them. Users with access to a personalization option can control it through the My Personalizations menu.

Security Administration Integrations

This section identifies the security integration points using:

- Component interfaces.
- Service operations.
- PeopleSoft Application Engine programs.

Component Interfaces

The following are the delivered component interfaces designed for security integration.

**DELETE_ROLE**

This component interface is based on the Delete Role (PURGE_ROLEDEFN) component, and it is used to purge roles. It is keyed by RoleName, and has the Get, Find, Save, Cancel methods. The DELETE_ROLE service operation calls this component interface.

**DELETE_USER_PROFILE**

This component interface is based on the Purge Inactive User Profile (PURGE_USR_PROFILE) component, and it is used to purge User Profiles. It is keyed by User ID, and has the Get, Find, Save, Cancel methods. The Delete_User_Profile service operation and the PURGEOLDUSRS Application Engine program call this component interface.

**ROLE_MAINT**

This component interface is based on the Roles (ROLEMAINT) component. It is keyed by RoleName and has the Cancel, Create, Find, and Get methods.

**USERMAINT_SELF**

This component interface is based on the My Profile (USERMAINT_SELF) component. It allows only the current user to access it.
USERMAINT_SELF is used with the following components: Forgot My Password (EMAIL_PSWD), Change Password (CHANGE_PASSWORD), and Change Expired Password (EXPIRE_CHANGE_PSWD).

**USER_PROFILE**

This component interface is based on the User Profiles (USERMAINT) component. It is keyed by User ID. USER_PROFILE is used in User Profile Save As, and with LDAP authentication.

**Service Operations**

The service operations described in this section are designed for security integration.

Keep the following in mind when dealing with these security service operations:

- There is a same-named service definition for each service operation.
- The service operations are asynchronous one-way.
- There is a same-named message defined in each service operation definition.
- There is at least one handler defined within each service operation definition, if the node is supposed to consume an inbound service operation.

**DELETE_ROLE**

This service operation is called from the Delete Role component. It is used to delete a role from subscribing databases. The service operation requires that the DELETE_ROLE component interface be authorized.

**DELETE_USER_PROFILE**

This service operation is called from the Delete User Profile component. It is used to delete a user profile from subscribing databases. This service operation requires that the DELETE_USER_PROFILE component interface be authorized.

**ROLESYNCHEXT_MSG**

This service operation is published when a Dynamic Role rule is run. It is called after the DYNROL_PUBL application engine program successfully finishes.

---

**Note.** As of release 8.49, the ROLESYNCH_MSG service operation is deprecated and replaced with ROLESYNCHEXT_MSG service operation.

**ROLE_MAINT**

This service operation publishes new roles and updates existing roles in the Roles component.

**USER_PROFILE**

This service operation may publish user messages when adds, updates, and deletes occur through User Profiles component (USERMAINT), the User Profile Save As component, the My System Profile component (USERMAINT_SELF), the Distributed User Profile component (USERMAINT_DIST), the USER_PROFILE component interface and the USERMAINT_SELF component interface.

User Profile messages may also be published when Password is changed through Change My Password component (CHANGE_PASSWORD) or Expired Password component (EXPIRE_CHANGE_PSWD) by triggering the USERMAINT_SELF component interface.
Application Engine Programs

PeopleSoft delivers these Application Engine programs designed for use in your security implementation.

**DYNROLE**

The DYNROLE Application Engine program is called when Dynamic Role Rules are executed for a single user from the User Profile component.

You run this program from the Roles page in the Roles component. You can also schedule this program to run as needed through Process Scheduler.

**DYNROLE_PUBL**

The DYNROLE_PUBL Application Engine program is called when Dynamic Role Rules are executed for a single role from the Role component.

You run this program from the Roles page in the Roles component. You can also schedule this program to run as needed through Process Scheduler.

**PURGEOLDUSRS**

The PURGEOLDUSRS Application Engine program deletes users that have not signed on within a period specified on Password Controls.

You run this program by selecting PeopleTools, Security, User Profiles, Purge Inactive User Profiles; or by selecting PeopleTools, Security, Password Configuration, Password Controls, and then clicking Schedule button under Purge Inactive User Profiles. You can also schedule this program to run as needed through Process Scheduler.

**LDAPSCHEMA**

Application Engine Program that puts the LDAP Schema definition into the PeopleSoft database.

**LDAPMAP**

Application Engine program used to import and export data to and from the LDAP directory into or from a PeopleSoft table. The process is based on an LDAP Map.

You run this program by selecting PeopleTools, Security, Directory, Authentication Map.

---

Security Administration Implementation

This section discusses:

- Preparing to use PeopleSoft security.
- Administering security from applications.

**Preparing to Use PeopleSoft Security**

The functionality of security administration for your PeopleSoft applications is delivered as part of the standard installation of PeopleTools, which is provided with all PeopleSoft products.
To start administering security, install your PeopleSoft application according to the installation guide for your database platform.

**Other Sources of Information**

This section provides information to consider before you begin to manage your data. In addition to implementation considerations presented in this section, take advantage of all PeopleSoft sources of information, including the installation guides, release notes, and PeopleBooks.

**See Also**

“Security Administration Preface,” page xxiii

*Enterprise PeopleTools 8.49 PeopleBook: Getting Started with PeopleTools*

**Administering Security from Applications**

If you administer security information outside of the PeopleSoft security interface, for example using application-specific pages to define application security, you have the option of modifying the PeopleSoft security menus to include links to those pages. This provides administrators a convenient way to access application-specific security pages without having to spend time navigating to them.

You add the extra security links from a browser by selecting PeopleTools, Security, Security Objects, Security Links. You can add links to the User Profiles component, My System Profile page, the Role component, or the Permission List (ACCESS_CNTRL_LISTX) component. To add links to a security profile, select the appropriate page in the Security Links (SEC_OTHER_SETTINGS) component and add the link information for the target page. After you save the link information, the link appears on the Links page for the appropriate security profile.

---

**Active Flag**

Enables you to activate and deactivate links. Only those links with the Active Flag checked appear for system users.

**Description**

Add a description of the page that contains the extra security information. This description is the text that appears on the Links page for the security profile.

**Menu Name**

From the drop-down list add the menu name. This is the application in which the page resides, such as Administer HR Security.
<table>
<thead>
<tr>
<th><strong>Menu Bar Name</strong></th>
<th>From the drop-down list add the menu bar name, such as Use, Setup, Process, and so on.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bar Item Name</strong></td>
<td>From the drop-down list add the bar item name. For example, the bar item name for this page is Security Links.</td>
</tr>
<tr>
<td><strong>Item Name</strong></td>
<td>From the drop-down list add the item name. For example, the item names for this component are User, Role, My Profile, and Permission List.</td>
</tr>
<tr>
<td><strong>Test</strong></td>
<td>After you have added all the appropriate information, use this link to test the security link. If it does not work correctly, double check your selections for the previous options.</td>
</tr>
</tbody>
</table>

To add a Security Link:

2. Select the security profile type (user, role, or permission list) to which you want to add extra links.
3. If there are existing links, click the plus sign button to add a new row.
4. Add the appropriate link information (Menu Name, Menu Bar name, and so on) information.
5. After you’ve entered the appropriate link information, click Test to make sure the link is pointing to the correct target.
6. Save your work.

**Note.** If you need to migrate the security links setup data from one database to another. You can use the following Data Mover scripts, SECOTHER_EXPORT.DMS and SECOTHER_IMPORT.DMS. These scripts reside in the `PS_HOME`\scripts directory.

### Reviewing and Monitoring Your Security Implementation

PeopleSoft provides a collection of predefined queries that enable you to review, monitor, and audit system access by user, role, permission list so that you can detect discrepancies. The Common Queries page enables you to run the following sets of queries:

- User ID queries.
- Role queries.
- Permission list queries.
- PeopleTools objects queries.
- Definition Security queries.
- Access log queries.

To run a query, click the link, enter the appropriate criteria (such as User ID), and click View Results.
CHAPTER 2

Understanding PeopleSoft Security

This chapter discusses:

- Security basics.
- PeopleSoft online security.
- PeopleSoft authorization IDs.
- PeopleSoft sign-in.
- Implementation options.

Security Basics

Security is especially critical for core business applications, such as PeopleSoft applications. Typically, you do not want every department in your company to have access to all your applications. Nor do you want everyone within a department to have access to all the functions or all the data of a particular application. Additionally, you may want to restrict who can customize your applications with PeopleTools.

PeopleSoft software provides security features, including components and PeopleTools applications, to ensure that your sensitive application data, such as employee salaries, performance reviews, or home addresses, does not fall into the wrong hands. Most likely, you use other security tools for your network and relational database management system (RDBMS). These tools work together to protect the PeopleSoft system from unauthorized access.

As you implement the PeopleSoft Internet Architecture, you need a robust and scalable means by which you can grant authorization to users efficiently. When you deploy your applications to the internet, the number of potential users of your system increases exponentially. Suddenly, you have customers, vendors, suppliers, employees, and prospects all using the same system.

The PeopleSoft security approach is tailored for the internet. It enables you to easily create and maintain security definitions, and you can perform many maintenance tasks programmatically.

You can apply security to all users, including employees, managers, customers, contractors, and suppliers. You group your users according to roles to give them different degrees of access. For instance, there might be an Employee role, a Manager role, and an Administrator role. Users who belong to a particular role require a specific set of permissions, or authorizations, within your system, so that they can complete their daily tasks.

You must also secure the objects and definitions in your PeopleSoft development environment. Just as you restrict sets of end users from accessing particular pages and components, you also restrict the definitions that your site’s developers can access using PeopleSoft Application Designer. A definition refers to any of the definitions that you create within PeopleSoft Application Designer, such as records, pages, or components. Each object definition may have individual security needs. For example, you may have a large development staff, but perhaps you want only a few developers to have access to specific record definitions.
PeopleSoft Security Definitions

Because deploying your applications to the internet significantly increases the number of potential users your system must accommodate, you need an efficient method of granting authorization to different user types. PeopleSoft security definitions provide a modular means to apply security attributes in a scalable manner.

A security definition refers to a collection of related security attributes that you create using PeopleTools Security. The three main PeopleSoft security definition types are:

- User profiles.
- Roles.
- Permission lists.

Note. There is also a PeopleSoft security definition called an Access Profile, but these are defined at the database level.

User Profiles

User profiles define individual PeopleSoft users.

Each user has an individual user profile, which in turn is linked to one or more roles. You add one or more permission lists, which ultimately control what a user can and can’t access, to each role. A few permission types are assigned directly to the user profile.

Typically, a user profile must be linked to at least one role in order to be a valid profile. The majority of values that make up a user profile are inherited from the linked roles.

Roles

Roles are intermediate objects that link user profiles to permission lists. You can assign multiple roles to a user profile, and you can assign multiple permission lists to a role. Some examples of roles might be Employee, Manager, Customer, Vendor, and Student.

A manager is also an employee, and may also be a student. Roles enable you to mix and match access appropriately.

You have two options when assigning roles: assign roles manually or assign them dynamically. When assigning roles dynamically, you use PeopleCode, LDAP, and PeopleSoft Query rules to assign user profiles to roles programmatically.

Permission Lists

Permission lists are groups of authorizations that you assign to roles. Permission lists store sign-in times, page access, PeopleTools access, and so on.

A permission list may contain one or more types of permissions. The fewer types of permissions in a permission list, the more modular and scalable your implementation.

A user profile inherits most of its permissions through roles, but you apply some permission lists, such as process profile or row-level security (data permissions), directly to a user profile.

The PeopleSoft Customer Connection website
PeopleSoft Online Security

The PeopleSoft system has many elements, such as batch processes, object definitions, and application data. Use PeopleTools security tools to control access to most of these elements. To secure other elements, you use application-specific interfaces, such as Administer Security.

This section discusses:

• Sign-in and time-out security.
• Page and dialog box security.
• Batch environment security.
• Definition security.
• Application data security.
• PeopleSoft Internet Architecture security.

Sign-in and Time-out Security

When a user attempts to sign in to PeopleSoft, he or she enters a user ID and a password on the PeopleSoft Signon page. If the ID and password are valid, PeopleSoft connects the user to the application, and the system retrieves the appropriate user profile.

If the user attempts to sign in during an invalid sign-in time as defined in the user’s security profile, he or she is not allowed to sign in. A sign-in time is an adjustable interval during which a user is allowed to sign in to PeopleSoft. For example, if a given sign-in time is Monday through Friday from 7 a.m. to 6 p.m. for a set of users, those users cannot access a PeopleSoft application on Saturday or on Friday at 6:05 p.m. If a user is signed in when the sign-in period expires, PeopleSoft signs the user out automatically.

After signing in, a user can stay connected as long as the sign-in time allows and as long as the browser doesn’t sit idle for longer than the timeout interval. A timeout interval specifies how long the user’s machine can remain idle—no keystrokes, no SQL—before the PeopleSoft system automatically signs the user out of the application.

You specify both the sign-in times and time-out interval using PeopleTools Security.

Note. Other timeout intervals, unrelated to security, are controlled by your web server and by PeopleSoft Pure Internet Architecture components.

Page and Dialog Box Security

You can restrict access to PeopleSoft menus. You can set the access rights to the entire menu, such as Administer Workforce or PeopleTools Security, or just a specific item on that menu. Because the only normal way to access a PeopleSoft page is through a menu, if a user has no access to a particular menu or menu item, then you have effectively restricted that user’s access to the corresponding page.

You can also restrict access to specific actions or commands on a page. For example, you may want a clerk in your sales office to be able to access contract data, but not be able to update the data. In this case, you grant access to the set of pages, but you allow display only access only. In this case, the clerk cannot update or correct any data. This approach enables users to get their work done while maintaining the security and integrity of your business data.
Batch Environment Security

If a particular user must run batch processes using PeopleSoft Process Scheduler, assign the appropriate process profile to the user profile and create process groups for your processes. A user receives both process group and process profile authorizations through permission lists. A user gets permission to process groups through roles, and they get a process profile through the process profile permission list.

**Note.** You add the process profile permission list directly to the user profile, not to an intermediary role.

Process Security

Because PeopleSoft applications take advantage of other applications, such as SQR and COBOL, your batch processes should be run in in a secure environment.

There are three levels of security for batch programs:

- Each batch program has a run control that you define before you can run the batch program.
  - Run controls are set up using PeopleSoft Process Scheduler
- PeopleSoft Process Scheduler enables you to set up process groups, which are groups of batch processes.
  - In PeopleTools Security you add process groups to a security profile. Users can run processes that belong to the process groups assigned to their security profile.
- In your RDBMS environment, you can restrict offline access to batch processes using the security tools described in your platform manuals.

Reporting Security

PeopleSoft Report Manager uses a logical space on a web server called the Report Repository. PeopleSoft Report Manager enables you to generate and distribute reports over the internet, and it stores the output in the Report Repository. Wherever you decide to situate your repository, make sure that the server is protected from outside access. Ensure that only the PeopleSoft system can access and distribute the generated reports. The Report Repository servlet gets items from the web server and puts them in the browser. With report distribution, you distribute reports and view them according to your role.

PeopleSoft delivers these roles for the specific use in reporting:

- ReportDistAdmin
- ReportSuperUser

Definition Security

Use Definition Security to govern access to database object definitions, such as record definitions, field definitions, and page definitions, and to protect particular object definitions from being modified by certain developers.

Application Data Security

Definition security is a form of data security—you use it to control access to particular rows of data (object definitions) in PeopleTools tables. PeopleSoft software also provides other methods to control the application data that a user is allowed to access in the PeopleSoft system. This task is also known as setting data permissions.

With application data security, you can set data permissions at the following levels:
- Table level (for queries only).
- Row level.
- Field level.

**Table-Level Security**

You use PeopleSoft Query to build SQL queries and retrieve information from application tables. For each PeopleSoft Query user, you can specify the records the user is allowed to access when building and running queries. You do this by creating query access groups in PeopleSoft Tree Manager, and then assigning users to those groups with PeopleSoft Query security. PeopleSoft Query security is enforced only when using PeopleSoft Query; it doesn’t control runtime page access to table data.

**Row-Level Security**

You can design special types of SQL views—security views—to control access to individual rows of data stored within application database tables. Row-level security enables you to specify the data that a particular user is permitted to access. PeopleSoft applications are delivered with built-in row-level security functions that are tailored to specific applications.

For example, PeopleSoft Human Resources security tables enable you to restrict user access to employee rows of data according to organizational roles. You could also permit users to view and update rows for employees in their departments only. Similarly, in PeopleSoft Financials, you can use security views to determine access to business units and ledgers. You can also use security tables to grant privileges by access group to users who use PeopleSoft Query to access data from the database.

See the documentation for your application for details about implementing row-level security for your applications.

**Field Security**

Use PeopleCode to restrict access to particular fields or columns within application tables. For example, if you want a certain class of user to be able to access certain pages, but not to view a particular field on those pages, such as compensation rate, you can write PeopleCode to hide the field for that user class.

**PeopleSoft Internet Architecture Security**

PeopleSoft Internet Architecture security is also known as runtime security. Only authorized users can connect to the web and application server, and only authorized application servers can connect to a given database.

PeopleSoft software uses authentication tokens embedded in browser cookies to authorize users and enable single sign-in throughout the system. To secure links between elements of the system, including browsers, web servers, application servers, and database servers, PeopleSoft software incorporates a combination of Secure Sockets Layer (SSL) security and BEA Tuxedo and BEA Jolt encryption.

SSL is a protocol developed by Netscape that defines an interface for data encryption between network nodes. To establish an SSL-encrypted connection, the nodes must complete the SSL handshake. The simplified steps of the SSL handshake are as follows:

1. Client sends a request to connect.
2. Server responds to the connect request and sends a signed certificate.
3. Client verifies that the certificate signer is in its acceptable certificate authority list.
4. Client generates a session key to be used for encryption and sends it to the server encrypted with the server’s public key (from the certificate received in step 2).
5. Server uses a private key to decrypt the client generated session key.

Establishing an SSL connection requires two certificates: one containing the public key of the server (server certificate or public key certificate) and another to verify the certification authority that issued the server certificate (trusted root certificate). The server needs to be configured to issue the server certificate when a client requests an SSL connection and the client needs to be configured with the trusted root certificate of the certificate authority that issued the server certificate.

The nature of those configurations depends on both the protocol being used and the client and server platforms. In most cases you replace HTTP with LDAP. SSL is a lower level protocol than the application protocol, such as HTTP or LDAP. SSL works the same regardless of the application protocol.

Note. Establishing SSL connections with LDAP is not related to web server certificates or certificates used with PeopleSoft integration.

The system uses SSL encryption in the following locations:

- Between the browser and the web server.
- Between the application server and the integration gateway.
- Between the integration gateway and an external system.

The system uses BEA Tuxedo and BEA Jolt encryption in these locations:

- Between the web server and the application server.
- Between the integration gateway and a PeopleSoft system (BEA Jolt only).

Security between the application server and database is supplied by RDBMS connectivity.

PeopleSoft Integration Broker and portal products have additional security concerns, which are addressed in the documentation for those products.

Enterprise PeopleTools 8.49 PeopleBook: PeopleSoft Integration Broker

PeopleSoft Authorization IDs

The PeopleSoft system uses various authorization IDs and passwords to control user access. You use PeopleTools Security to assign two of these IDs: the user ID and the symbolic ID.

This section discusses:

- User IDs.
- Connect ID.
- Access IDs.
- Symbolic IDs.
- Administrator access.
See Also

User IDs

A PeopleSoft user ID is the ID you enter at the PeopleSoft sign-in dialog box. You assign each PeopleSoft user a user ID and password. The combination of these two items grants users online access to the PeopleSoft system. The system can also use a user ID stored within an LDAP directory server.

The user ID is the key used to identify the user profile definition.

Connect ID

The connect ID performs the initial connection to the database.

Note. PeopleSoft no longer creates users at the database level.

A connect ID is a valid user ID that, when used during sign-in, takes the place of PeopleSoft user IDs. Using a connect ID means you don’t have to create a new database user for every PeopleSoft user that you add to the system.

Note. A connect ID is required for a direct connection (two-tier connection) to the database. Application servers and two-tier Microsoft Windows clients require a connect ID. You specify the connect ID for an application server in the Signon section of the PSADMIN utility. For Microsoft Windows clients, you specify the connect ID in the Startup tab of PeopleSoft Configuration Manager. You can create a connect ID by running the Connect.SQL and Grant.SQL scripts.

Warning! Without a connect ID specified, the system assumes that workstation is accessing PeopleSoft through an application server. The option to override the database type is disabled.

Access IDs

When you create any user ID, you must assign it an access profile, which specifies an access ID and password.

The PeopleSoft access ID is the RDBMS ID with which PeopleSoft applications are ultimately connected to your database after the PeopleSoft system connects using the connect ID and validates the user ID and password. An access ID typically has all the RDBMS privileges necessary to access and manipulate data for an entire PeopleSoft application. The access ID should have Select, Update, and Delete access.

Users do not know their corresponding access IDs. They just sign in with their user IDs and passwords. Behind the scenes, the system signs them into the database using the access ID.

If users try to access the database directly with a query tool using their user or connect IDs, they have limited access. User and connect IDs only have access to the few PeopleSoft tables used during sign-in, and that access is Select-level only. Furthermore, PeopleSoft encrypts the sensitive data that resides in those tables.

Note. Access profiles are used when an application server connects to the database, when a Microsoft Windows workstation connects directly to the database, and when a batch job connects directly to the database. Access profiles are not used when end users access applications through Pure Internet Architecture. During a Pure Internet Architecture transaction, the application server maintains a persistent connection to the database, and the end users leverage the access ID that the application server domain used to sign in to the database.
Note. PeopleSoft suggests that you only use one access ID for your system. Some RDBMS do not permit more than one database table owner. If you create more than one access ID, it may require further steps to ensure that this ID has the correct rights to all PeopleSoft system tables.

**Symbolic IDs**

PeopleSoft encrypts the access ID when it is stored in the PeopleTools security tables. Consequently, an encrypted value can’t be readily referenced or accessed. So when the access ID, which is stored in PSACCESSPRFL, must be retrieved or referenced, the query selects the appropriate access ID by using the symbolic ID as a search key.

The symbolic ID acts as an intermediary entity between the user ID and the access ID. All the user IDs are associated with a symbolic ID, which in turn is associated with an access ID. If you change the access ID, you need to update only the reference of the access ID to the symbolic ID in the PSACCESSPRFL table. You do not need to update every user profile in the PSOPRDEFN table.

**Administrator Access**

As an administrator, you must customize your own user definition. PeopleSoft delivers at least one full-access user ID with each delivered database. Your first task should be to sign in with this ID and personalize it for your needs—or, create a new, full-access ID from scratch—being sure to specify a new password. You should change the passwords of all delivered IDs as soon as possible.

Note. PeopleSoft-delivered IDs and passwords are documented in your installation manual.

When you install PeopleSoft, you’re prompted for an RDBMS system administrator ID and password. This information is used to automatically create a default access profile. If you’ll be using more than one access profile, set up the others before creating any new PeopleSoft security definitions. Most sites only use one access profile.

The number of database-level IDs you create is up to your site requirements. However, in most cases, having fewer database-level IDs reduces maintenance issues.

For example, if you implement pure LDAP authentication, at a minimum you need two database-level IDs—your access ID and your connect ID. With this scenario, in PeopleSoft you need to maintain only a symbolic ID to reference the access ID and maintain a user ID that the application server uses during sign-in. With this minimal approach, each user who needs a two-tier connection, to run an upgrade, for example, could use the same user ID that the application server uses.

**PeopleSoft Sign-in**

This section discusses:

- PeopleSoft sign-in.
- Directory server integration.
- Authentication and signon PeopleCode.
- Single signon.
PeopleSoft Sign-in

The most common direct sign-in to the PeopleSoft database is the application server sign-in. These are the basic steps that are taken when the application server signs in to the database:

1. Initial connection.
   The application server starts, and uses the connect ID and user ID specified in its configuration file (PSAPPSRV.CFG) to perform the initial connection to the database.

2. The server performs a SQL Select statement on security tables.
   After the connect ID is verified, the application server performs a Select statement on PeopleTools security tables, such as PSOPRDEFN, PSACCESSPRFL, and PSSTATUS. From these tables, the application server gathers such items as the user ID and password, symbolic ID, access ID, and access password. After the application server has the required information, it disconnects.

3. The server reconnects with the access ID.
   When the system verifies that the access ID is valid, the application server begins the persistent connection to the database that all Pure Internet Architecture and Windows three-tier clients use to access the database. Typically, the users signing in using a Microsoft Windows workstation are developers using PeopleSoft Application Designer.

   **Note.** A Microsoft Windows workstation attempting a two-tier connection uses the same process as the application server.

PeopleSoft recommends that all connectivity be made through either a three-tier Microsoft Windows client or through the browser. A two-tier connection is no longer necessary other than for the application server, PeopleSoft Process Scheduler, or for a user who will be running upgrades or PeopleSoft Data Mover scripts.

Sign-in PeopleCode does not run during a two-tier connection, so maintaining two-tier users in an LDAP server is not supported.

Directory Server Integration

PeopleSoft recognizes that your site uses software produced by numerous vendors, and each different product requires security authorizations for users. Most of these products adhere to the model that includes user profiles and roles (or groups) to which users belong. PeopleSoft enables you to integrate your authentication scheme for the PeopleSoft system with your existing infrastructure. You can reuse user profiles and roles that are already defined within an LDAP directory service.

Organizations typically store user profiles in a central repository that serves user information for all of the programs that require it. The central repository is typically an LDAP directory server.

A directory server enables you to maintain a single, centralized user profile that you can use across all of your PeopleSoft and non-PeopleSoft applications. This approach reduces redundant maintenance of user information stored separately throughout your enterprise, and it reduces the possibility of user information getting out of synchronization.

You always maintain permission lists and roles using PeopleTools Security. However, you can maintain user profiles in PeopleTools Security or with an external LDAP server.

**See Also**

Chapter 6, “Employing LDAP Directory Services,” page 93
Authentication and Signon PeopleCode

You can store PeopleSoft passwords within PeopleTools, in the PSOPRDEFN table. You can also store and maintain user passwords and the rest of the user profile data in an LDAP directory server. PeopleSoft retrieves the information stored in an external directory server using a combination of the User Profiles component interface and sign-in PeopleCode.

If you decide to reuse existing user profiles stored in a directory server, you don’t need to perform dual maintenance on the two copies of the user data—one copy in the LDAP server and one copy in PSOPRDEFN. PeopleSoft ensures that the user information stays synchronized. If you configure LDAP authentication, you maintain your user profiles in LDAP and not in PeopleTools Security.

Signon PeopleCode copies the most recent user profile data from a directory server to the local database whenever a user signs in. PeopleSoft applications reference the user information stored in the PeopleSoft database rather than making a call to the LDAP directory each time the system requires user profile information. Signon PeopleCode ensures the local database has a current copy of the user profile based on the information in the directory. Each time the user signs in, signon PeopleCode checks to see if the row in the user profile cache needs to be updated.

The sign-in process occurs as follows:

1. The user enters a user ID and password on the sign-in page.
2. PeopleTools attempts to authenticate the user against the PSOPRDEFN table.
   The default signon PeopleCode program updates the user profile based on the current data stored in the directory server.

You can use signon PeopleCode and business interlinks to synchronize the local copy of the user profile with any data source at sign-in time—the program that ships with PeopleTools is designed to synchronize the user profile with an LDAP directory server only. Because the sign-in program is PeopleCode, you can modify it, incorporating any of the PeopleSoft integration technologies that PeopleCode supports.

To edit the signon PeopleCode program, you open the LDAP function library record and use the PeopleCode editor to customize the PeopleCode. Developers who modify the sign-in PeopleCode program need to have a good understanding of PeopleCode and the integration features it offers.

Note. Only users who signon through Pure Internet Architecture or three-tier Microsoft Windows clients take advantage of sign-in PeopleCode.

Single Signon

Pure Internet Architecture uses browser cookies for seamless single signon across all PeopleSoft nodes. A node refers to a database and the application servers connected to it. For example, a user can complete a PeopleSoft Human Resources transaction, and then click a link for a PeopleSoft Financials transaction without ever reentering a password. Single signon is especially important to the PeopleSoft portal, which aggregates content from several different applications and data sources into a single, integrated display.

See Also

Chapter 8, “Implementing Single Signon,” page 139
Implementation Options

By using our integration technologies, you can configure PeopleSoft security to work with numerous schemes. This section discusses:

- Authentication.
- Role assignments.
- Cross-system synchronization.

Authentication

Consider how you plan to authorize users as they sign in to your PeopleSoft system. Do you want to store and maintain the PeopleSoft user passwords within PeopleSoft, or do you plan to take advantage of existing user profiles in an external directory server?

PeopleSoft-Based Authentication

This option is, generally, the way PeopleSoft customers have authorized users in previous releases. PeopleSoft user passwords are stored and maintained solely within PeopleSoft. Although this method does not require a large amount of storage, it does add administration issues, mainly because PeopleSoft passwords are yet another password users need to remember.

With this option there are only two database-level IDs, the access ID and the connect ID. The passwords reside in the PSOPRDEFN along with the other user information.

Directory-Based Authentication

You can also use a central repository for user information in a directory server that uses the LDAP protocol.

The advantage of this option is that a user has one user ID and password that allows access to numerous software systems.

Role Assignments

Consider how you plan to assign authorizations to your users. Recall that users inherit permissions through the roles to which they are assigned. When you plan your authorization assignment, you are really planning how you intend to assign roles to users. There are two ways to assign roles to users: the static approach and the dynamic approach.

Static

Using the static approach, you assign users to roles manually. The static approach is not scalable to the thousands of users that are likely to use your system when you deploy applications to the internet.

The static approach requires an administrator to maintain each user’s set of roles. For that reason, PeopleSoft recommends that you explore and implement the dynamic assignment of roles.

Dynamic

Using the dynamic approach, the system assigns roles based on business rules. You can manually run the rule, but typically, you run the rules from a scheduled batch process.
Suppose an employee changes jobs and becomes a manager in a new department. When you run your dynamic rule, the system removes the roles associated with the employee’s previous position and then adds the appropriate roles required for the new position. In addition, you can have the rule publish a message to other nodes, such as a PeopleSoft Financials node, that might subscribe to changes in the PeopleSoft Human Resources database.

You can use PeopleSoft Query, LDAP, or PeopleCode to define dynamic role assignment. If necessary, you can use a combined approach with the rules for assigning roles. For example, you can have one role rule based on LDAP, another based on a query, and so on. You can also have multiple rule types for one role. For example, a Manager role could be derived partially from an LDAP rule and partially from a PeopleSoft Query rule. As the following list describes, where the information that drives your role assignments is stored determines the types of role rules you use:

- If the membership data for your roles resides in your PeopleSoft database, use PeopleSoft Query to construct your role rules.
  
  One query could be MANAGER, another EMPLOYEE, and so on. When the rule runs, the system assigns your employee users to the EMPLOYEE role and the manager employees to the MANAGER role based on the results returned from the query.

- If you already have LDAP directory server groups organized by region, department, position, and so on, base your rules on the existing LDAP structure.
  
  Based on the directory setup and hierarchy, your rule assigns PeopleSoft users to the appropriate roles. PeopleSoft uses your existing LDAP configuration. You should use this role rule type in conjunction with LDAP authentication.

- If you have user information in other third-party systems, such as legacy mainframe applications or UNIX account groups, use PeopleCode.
  
  You can take advantage of the integration technologies that PeopleCode supports, such as business interlinks and component interfaces. The business interlinks retrieve the data from the external system and write it to the role assignment tables in the PeopleSoft database.

**Cross-System Synchronization**

If you have multiple PeopleSoft systems, consider how to keep user information synchronized. This is especially important for the portal deployment, where users are likely to move from one system to another seamlessly. For instance, after completing a transaction in PeopleSoft Human Resources, a user may click a link that takes her directly to PeopleSoft Financials.

If you are using dynamic role assignment, the dynamic role batch program, by default, publishes a message that indicates a particular change. You need to make sure that nodes that require such information changes are configured to subscribe to the message that publishes the changed data. For example, suppose PeopleSoft Financials needs a list of managers for a particular transaction. Because the manager information resides in PeopleSoft Human Resources, PeopleSoft Human Resources publishes any changed information to PeopleSoft Financials to keep the data synchronized.

PeopleSoft security also publishes a message when a user profile changes (if the corresponding Service Operation version is active). This is most useful if you are not using LDAP to store user information. If you store user information in the PeopleSoft system, the message makes sure that password changes are replicated across multiple databases. If you store your user information in a central LDAP server, then the passwords, and so on, are already—in a sense—synchronized.

You can upgrade permission lists and roles using the PeopleSoft Application Designer upgrade features. For user information, PeopleSoft Data Mover scripts migrate user profiles between systems for upgrades or bulk loads.
CHAPTER 3

Setting Up Permission Lists

This chapter provides an overview of permission lists and discusses how to:

• Manage permission lists.
• Define permissions.

Understanding Permission Lists

Permission lists are the building blocks of user security authorizations. You typically create permission lists before you create user profiles and roles. When defining permission lists, however, consider the roles and user profiles with which you will use them. Recall that roles are intermediary objects between permission lists and users. You use roles to assign permissions to users dynamically.

Permission lists may contain any number of permissions, such as sign-in times, page permissions, web services permissions, and so on. Permission lists are more flexible and scalable when they contain fewer permissions.

The following diagram illustrates how permission lists are assigned to roles, which are then assigned to user profiles. A role may contain numerous permissions, and a user profile may have numerous roles assigned to it. A user inherits all permissions assigned to each role to which the user belongs. User access is determined by the combination of all assigned roles.
The diagram represents the security authorizations of Tom Sawyer. Mr. Sawyer inherits the five permission lists that are assigned to the two roles that are assigned to his user profile. In this example, he has access to the employee self-service pages, the service monitor, PeopleSoft Process Monitor, and PeopleTools Security. If Tom were to become a manager, then the permission lists assigned to the Manager role would be added to his profile.

Theoretically, you could create a permission list tailored for every role, and that permission list could contain a permission for every category, from General to Web Libraries. However, permission lists like this do not scale to encompass roles that might be similar, but not exactly alike. For a similar role, you’d have to create a new role from the beginning. This kind of approach is not efficient for larger, more complicated implementations.

Alternatively, you can use a more modular, or mix-and-match, approach where you create numerous, generic permission lists that you can add to and remove from role definitions. Suppose you have three 8-hour shifts at your site. Using the modular approach, you could create three different versions of sign-in permissions: one for 6 a.m. to 2 p.m., one for 2 p.m. to 10 p.m., and another for 10 p.m. to 6 a.m. Then, depending on the shift for a particular role, you can easily apply or remove the appropriate permission as needed without affecting any other permissions.

Although how you decide to implement Permission Lists depends on your site’s security scheme and your security administrator, the modular approach provides increased scalability. As a general rule, your permission lists should be assigned to roles so that the common user has between 10 to 20 lists. This range represents the best balance of performance and flexibility. If you have too many permission lists, you may notice performance degradation, and if you have too few permission lists, you may sacrifice flexibility.
Managing Permission Lists

This section discusses how to:

- Create new permission lists.
- Copy permission lists.
- Delete permission lists.
- View related content references.
- Add links.
- Run permission list queries.

Creating New Permission Lists

To create a new permission list:

2. On the search page, click Add a New Value.
3. In the Permission List edit box, enter the name of permission list to create.

   **Note.** Permission list names have a 30-character limit. PeopleSoft HCM requires certain naming conventions for permission lists, but PeopleTools does not enforce these application-specific requirements. Therefore, when creating permission lists, keep in mind that PeopleSoft HCM requires primary permission lists to start with PP, and data permission lists to start with DP.

4. From the pages in the Permission List component, select the appropriate permissions.
5. Save your permission list.

Copying Permission Lists

To copy a permission list:

2. On the search page, locate and select the permission list that you want to copy (clone).
   
   The Permission List Save As page appears.

3. On the Permission List Save As page, enter a new name in the To: edit box for the permission list that you want to copy.
4. Click Save.

   **Note.** When copying a permission list, you also copy the access specified for content references by the original permission list. When deleting a permission list, you also remove access to the content references associated with that permission list.

Deleting Permission Lists

To delete a permission list:

2. On the search page, locate and select the permission list that you want to delete.
   The Delete Permission List page appears.
3. Click Delete Permission List.
4. Click OK to confirm the deletion, or click Cancel to end without deleting.

**Note.** This deletes content reference permissions and all references to the permission list (even where referenced in application data).

## Viewing Related Content References

This section discusses:

- Viewing content references.
- Synchronizing content references.

### Viewing Content References

Select PeopleTools, Security, Permissions & Roles, Permission Lists, Pages to access the Pages page, then click the Edit Components link to access the Component Permissions page.

When you set component permissions and web library permissions, use the View Content References link to view the content references pointing to a given component or script. PeopleTools automatically propagates changes to permission lists to the content references.

When you click the link, the Content References page appears, showing the following:

- Name of the portal.
- Name of the content reference.
- The label.
- Whether or not it is accessible.
- The path.

### Synchronizing Permission Lists and Content References

Use the PORTAL_CSS application engine program to synchronize permission lists with content references for the portal. By default, the system synchronizes changes in permission lists with content references; however, after an upgrade or any time when you want to make sure, you can run the PORTAL_CSS program. There is a process definition of the same name.

### Adding Links

Select PeopleTools, Security, Permissions & Roles,Permission Lists, Links to access the Links page.

Use this page to add links to other pages within your PeopleSoft system that pertain to a particular permission list. For example, perhaps a PeopleSoft application requires a specific security setting to be attached to a permission list. If this application-specific setting appears on a page not in PeopleTools, Security, add a link to that page so that anyone updating the permission list can easily navigate to it.
You create your inventory of links to security settings that exist outside of PeopleTools Security using the Security Links page. After being created and assigned to a security definition, such as a permission list, then the links appear in the security definition’s list of links.

**See Also**

Chapter 1, “Getting Started with Security Administration,” Administering Security from Applications, page 7

**Running Permission List Queries**

Select PeopleTools, Security, Permissions & Roles, Permission Lists, Permission List Queries to access the Permission List Queries page.

Permission list queries enable you to run queries that provide detailed information regarding a permission, such as the user IDs and roles associated with a permission list. The available queries are documented on the page.

To run a permission list query:

1. Click the link associated with the query you want to run.
   
   This invokes a new browser window.

2. View the information the query returns, or select a download option.
   
   For downloading, you have the following options:

   - Microsoft Excel spreadsheet.
     
     Downloads the query results as a Microsoft Excel spreadsheet (.xls) file.
   
   - CSV text file.
     
     Downloads the query results as a comma-separated values (.csv) file.

**Defining Permissions**

This section discusses how to:

- Set general permissions.
- Set page permissions.
- Set PeopleTools permissions.
- Set process permissions.
- Set sign-in time permissions.
- Set component interface permissions.
- Set service monitor permissions.
- Set web library permissions.
- Set personalization permissions.
- Set query permissions.
- Set mass change permissions.
- View when a permission list was last updated.
## Pages Used to Define Permission Lists

<table>
<thead>
<tr>

<td>PLIST_OPTN</td>
<td>PeopleTools, Security, Permissions and Roles, Permission Lists, Personalizations</td>
<td>Specify which personalizations users can use and customize.</td>
</tr>
<tr>
<td>Query</td>
<td>PERMLIST_QUERY</td>
<td>PeopleTools, Security, Permissions and Roles, Permission Lists, Query</td>
<td>Control the query operations a user can perform and the data a user can access while using PeopleSoft Query.</td>
</tr>
</tbody>
</table>
### Setting General Permissions

Access the Permission Lists - General page.

<table>
<thead>
<tr>
<th>General</th>
<th>Pages</th>
<th>PeopleTools</th>
<th>Process</th>
<th>Sign-on Times</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permission List:</td>
<td>ALLPAGES</td>
<td>Description:</td>
<td>All pages and weblibs</td>
<td></td>
</tr>
<tr>
<td>Navigator Homepage:</td>
<td>NAVIGATOR</td>
<td>Can Start Application Server?</td>
<td>☑</td>
<td></td>
</tr>
<tr>
<td>Allow Password to be Emailed?</td>
<td>☐</td>
<td>Time-out Minutes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Never Time-out</td>
<td></td>
<td>Specific Time-out (minutes)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Navigator Homepage

Select a graphic representation of a business process that is displayed by PeopleSoft Navigator. For each security profile definition, you can specify a map to be displayed on startup.

If this is the user profile’s PeopleSoft Navigator homepage permission list, the system is passed this value at runtime.

#### Can Start Application Server?

Select to enable user profiles with this permission list to start PeopleSoft application servers.

**Note.** This setting also applies to starting PeopleSoft Process Scheduler servers.

Typically, you’ll create a user profile that’s dedicated to starting application servers. When you define an application server domain, one of the parameters you specify in PSADMIN is the PeopleSoft user ID (and password) for that profile, which must be associated with at least one permission list that has this option enabled. The user ID and password are stored in the Startup section of the PSAPPSRV.CFG file, which BEA Tuxedo reads when the application server is started.

In many installations, an application server starts with an automated process. A user profile with this property enabled shouldn’t be used by an actual...
user who signs in to the application server and starts it by submitting the appropriate commands.

**Note.** Password controls don’t apply when a password is used for two-tier activities like starting application servers. They apply only when the password is used to sign in over three-tier connections.

**Important!** For a given user profile, the password controls that you set for account lockout (maximum logon attempts) and age (expiration) apply to three-tier and web sign-in only, and don’t apply if the user profile is used just for two-tier activities like starting an application server or process scheduler.

However, make sure that you don’t use the same user profile for both types of activities. When you use it for both three-tier and web sign-in, the profile becomes subject to the account lockout and age controls, which prevents it from completing the two-tier activities.

<table>
<thead>
<tr>
<th>Allow Password to be Emailed?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select to enable users to receive forgotten passwords through email. At some sites, the security administrator may not want passwords appearing unencrypted in any email. You implement this feature by permission list. None can use it, some can use it, or all can use it depending upon your implementation. Users who do not have the proper authority receive an error message if they attempt to have a new password emailed to them.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Never Time-Out and Specific Time-out (minutes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select the number of minutes of inactivity allowed at a terminal before the system automatically signs the user out of the PeopleSoft online system. Inactivity means no mouse clicks, keystrokes, import, file print, or SQL activity. The default time-out minutes setting is Never Time-out.</td>
</tr>
</tbody>
</table>

**Note.** Time out limits are also controlled at the web server and application server levels.

If you select Never Time-out, an inactive user is never automatically signed out. Otherwise, select Specific Time-out (minutes) and enter the appropriate value in minutes. A custom time-out interval:

- Must be a positive integer.
- Can’t contain edit characters, such as commas or a $.
- Must be a SMALLINT in the valid range allowed for this field (0-32767).

Entering a value of zero (0) is equivalent to selecting Never Time-out.

To comply with the Americans with Disabilities Act (ADA), you might set up most permission lists to time out in 20 minutes, but create a special ADA permission list where timeout occurs after 60 minutes.

**Note.** Because timeout limits are also controlled at the web server level, you’ll need to change the web server timeout values also.

**Setting Page Permissions**

Access the Permission Lists - Pages page.
Permission List: ALLPAGES

Description: All pages and weblibs

### Mobile Page Permissions

**Mobile Page Permissions**

Click to grant access to mobile application pages.

**Menu Name**

Displays all menu names in the database. Add new rows to add more menu names. The name reflects the definition name in PeopleSoft Application Designer.

**Menu Label**

Displays the menu label associated with the PeopleSoft Application Designer menu name.

**Edit Components**

Click to grant access to specific pages.

Page permissions refer to the pages to which a user has access. Pages are contained within components, which are ultimately contained within a menu name. To grant access to a particular page, determine the component it is in and the menu name the component falls under. This enables you to drill down to the appropriate page.

**Note.** To find the name of a page, you can press CTRL+J while accessing the page with the browser, or use the Find Definition References feature in PeopleSoft Application Designer.

Granting access to PeopleTools and PeopleSoft applications requires serious considerations. For each role, carefully consider what the members of that role must access to complete their jobs and to what degree they need access. Then make the appropriate permission lists.

After you add a menu name, you grant access to its components and pages on an item-by-item basis. In PeopleSoft applications, menu items represent components. If a component consists of more than one page, then selecting the menu item opens another layer with more items—individual pages. For example, if you added the UTILITIES menu name to a permission list, you could then grant access to the Utilities, Use menu items but not to the Utilities, Process menu items. Or you could grant access to only a few of the Use menu items, or make some items display only.
There are two categories of components to which you grant access permission:

- All PeopleSoft applications.
- Page-driven PeopleTools.

**Note.** With PeopleTools programs, the process of editing menu items varies. With page-based PeopleTools, such as PeopleSoft Process Scheduler, you can grant access to menu items just as you can for PeopleSoft applications. However, the other PeopleTools programs don’t allow you to grant item-by-item access; you can either access all the menus and menu items or you can’t. PeopleSoft Application Designer is an exception; you can restrict access to it at the definition level.

### Granting Access to Components and Pages

The following procedure describes how to set access permissions to your PeopleSoft applications and your page-driven PeopleTools. You begin at the component level and drill down to the page level making the appropriate selections as you go.

**Note.** The same procedure applies to both PeopleSoft applications and page-driven PeopleTools.

To add access to PeopleSoft components and pages:

1. Locate the menu name of the component to which you want to add access.
2. Click Edit Components.
   - The Components page appears.
3. Locate the component to which you want to grant access.
   - By default, when adding a new permission list, no components are authorized.
4. Click the Edit Pages button associated with each component to which you want to grant access.
   - The Page Permissions page appears. You specify the actions that a user can complete on the page. You have the following options for each page that appears in the Page column:
     - **Authorized?**
       - Select to enable a user to access the page. Decide the degree to which a user is authorized on a page by selecting Display Only or one or more of the available options in the Actions group.
     - **Display Only.**
       - Select to enable the user to view the information provided by the page, but not to alter any data.
     - **Actions.**
       - Specify how users can alter information on a page, such as Add, Update/Display, and Correction. The available options depend upon the options selected when the page was initially developed in PeopleSoft Application Designer.
       - To grant access to all pages and all actions for each page, click Select All.
5. When you have finished making the appropriate selections, click OK on the Page Permissions page, and then again on the Component Permissions page.
   - Repeat each step for each menu name.

**Note.** After you delete access to a component or iScript, you must clear the browser cache or wait for 20 minutes (default time) for the deletion to appear on the menu.
Granting Access to Mobile Pages

To add access to mobile pages:

1. Select PeopleTools, Security, Permissions & Roles, Permission Lists, and select the Pages page.
2. Click the Mobile Page Permissions link.
   The Mobile Page Permissions page appears.
3. To add a new mobile page to the permission list, click the plus sign.
4. For the Mobile Page Name edit box, click the search button.
5. Search for and select the mobile page for which you need to grant access.
6. Click OK.
7. Save the permission list.

Setting PeopleTools Permissions

Access the Permission Lists - PeopleTools page.

The PeopleTools Permissions section of this page applies to standalone PeopleTools applications. They aren’t Pure Internet Architecture-based, but are Microsoft Windows programs that weren’t developed using PeopleSoft Application Designer. They include:

• PeopleSoft Application Designer.
• PeopleSoft Data Mover.
• PeopleSoft Definition Security.
• PeopleSoft Query (Microsoft Windows interface, not the browser interface).

The Performance Monitor PPMI Access check box doesn’t control access to an application; rather, it enables PeopleSoft Performance Monitor data collators to insert performance data into the database, which enables you to view the data.

See Enterprise PeopleTools 8.49 PeopleBook: PeopleSoft Performance Monitor.

To grant access to these PeopleTools features, select the check box next to the appropriate item.

With PeopleSoft Application Designer, the procedure for applying permissions is slightly more complex, because security for PeopleSoft Application Designer also controls what object definition types can be accessed and what degree of modifications can be made. The links on this page (Definition Permissions, Tools Permissions, and Miscellaneous Permissions) enable you to provide more detail to PeopleSoft Application Designer access permissions.

Definition Permissions

Select Definition Permissions to access the Definition Permissions page.

<table>
<thead>
<tr>

PeopleTools Permissions — Definition Permissions page

Grant access to the definitions that developers create using PeopleSoft Application Designer. Each type of definition that you create with PeopleSoft Application Designer appears in the definition permissions list.

Note. On this page you add permissions to a definition type, such as Application Engine programs. You grant access to specific definitions, such as PeopleSoft Payroll Application Engine programs, using Definition Security.

Access

Select the appropriate access level. Options are:

*Full Access:* Definitions of the specified type can be modified. For records, this setting allows access to the Build dialog box.

*No Access:* No definitions of the specified type can be opened.
Chapter 3 Setting Up Permission Lists

Read-Only: Definitions of the specified type can be opened and viewed but not modified.

Update translates only: This level applies only to fields. This allows a user to modify only Translate table values.

Data admin only: This level applies only to records. It allows a user to modify only those record attributes found in the Tools, Data Administration menu (tablespaces, indexes, and record DDL).

Full Access (ALL), Read Only (ALL) and No Access (ALL) Click to set all definition types in the list to the same access level.

Note. If change control locking is enabled, the Change Control access setting on the Tools Permissions page can override object types settings.

Tools Permissions

In addition to securing definitions, PeopleSoft Application Designer security also involves a collection of tools, such as Build and the PeopleCode Debugger, to which developers need access.

The tools within PeopleSoft Application Designer include the following:

• Build/Data Admin (select Build, Project and Tools, Data Administration).
• Change Control (select Tools, Change Control).
• Language Translations (select Tools, Translations).
• PeopleCode Debugger (select Debug, PeopleCode Debugger Mode).
• SQL Editor (the PeopleSoft Application Designer utility for adding SQL objects and statements to applications and application engine programs).
• Upgrade (select Tools, Upgrade).

This includes Copy Project, Compare and Report, and so on.

You can set the access level individually for the Tools Permissions page options or you can use the (ALL) buttons to set across the board settings. Remember that every button affects every access level for the tools.

Build/Data Admin Control access to the Build and Tools, Data Administration menu items. Select from:

• No access. The user cannot access the Build menu items or the Tools, Data Administration menu items.

Note. This setting is not available if you’ve set records access to No Access or to Data Admin only.

• Build scripts only. A user with this access level can use the Build dialog box options, but the Execute SQL now and Execute and build script options are disabled. The Tools, Data Administration menu items are not available.
Setting Up Permission Lists

Chapter 3

Note. This setting is not available if you’ve set records access to No Access.

- **Build Online.** With this access level, a user can use all Build dialog options, but the Tools, Data Administration menu items are not available.

Note. This setting is not available if you’ve set records access to No Access.

- **Full data admin access.** A user with this access level can use all the Build dialog options and access the Tools, Data Administration menu items.

Note. This setting is not available if you’ve set records access to No Access or to Read-only access.

**Change Control**

The change control access levels are valid only when change control is enabled. You enable change control locking using PeopleSoft Application Designer. Select from:

- **Restricted access.** Restricts users from locking or unlocking objects. When change control locking is enabled, users with restricted access can only view PeopleSoft Application Designer definitions—they cannot create, modify, or delete them.

Note. With locking enabled, this setting overrides any Full Access settings on the Object Permissions page or Miscellaneous Permissions page.

- **Developer access.** The user can lock any unlocked objects and unlock any objects that he or she has locked.

- **Supervisor access.** The user can unlock any locked objects, regardless of who has locked them.

**Language Translations**

Set only two levels of access, **No access** and **Full access.** Enable this set of menu options for people involved in translating or globalizing your applications.

**PeopleCode Debugger**

Restrict access to the PeopleCode Debugger.

**SQL Editor**

Restrict developers from modifying the SQL in your applications.

**Upgrade**

Select **No access** to make all the Upgrade menu items on the Tools menu unavailable. Developers can still access the Upgrade view and modify upgrade settings in the project definition, but they cannot run any of the upgrade processes.

With **Read-only access**, users can run compare reports against the database, but they cannot copy objects into the database.

The following table shows the relationship between the permissions that are set up within the source and the target databases, which you should consider in upgrade situations.
### Source DB | Target DB | Compare? | Copy? | Export? | Import?  
---|---|---|---|---|---
No access | No access | No | No | No | No  
No access | Read-only access | No | No | No | No  
No access | Full access | No | No | No | No  
Read-only access | No access | No | No | Yes | No  
Read-only access | Read-only access | Yes | No | Yes | No  
Read-only access | Full access | Yes | Yes | Yes | No  
Full access | No access | No | No | Yes | Yes  
Full access | Read-only access | Yes | No | Yes | Yes  
Full access | Full access | Yes | Yes | Yes | Yes

### Miscellaneous Permissions

Set access levels for the Miscellaneous Definitions items that appear in the PeopleSoft Application Designer Tools menu, including Access Profiles, Color, Field Format, Style, and Tool Bar.

Each of the miscellaneous definitions can be set for *No access*, *Read-only access*, or *Full access*. You can select the (ALL) buttons to grant the same permissions to each item.

### Realtime Event Notification Permissions

Select this link to access the REN Permissions (Realtime Event Notification Permissions) page.

### Data Archival

Use the PeopleSoft Data Archive Manager application to archive your data as part of regular database maintenance. The security options in this group relate specifically to actions a system administrator would make while using PeopleSoft Data Archive Manager. The actions that a system administrator can perform within PeopleSoft Data Archive Manager are controlled by permission lists. Before you grant any permissions to these actions, read the PeopleSoft Data Archive Manager documentation.
Note. PeopleSoft Data Archive Manager is a page-driven PeopleTools application, but on this page you enable specific operations used within the archiving process.

See Also

*Enterprise PeopleTools 8.49 PeopleBook: Data Management*, “Using PeopleSoft Data Archive Manager”

**Setting Process Permissions**

Just as you define permissions for the pages a user can access, it is also critical to specify the batch (and online) processes that users can invoke through PeopleSoft Process Scheduler. Typically, process groups are arranged by department or task. For example, the batch programs having to do with your payroll department probably all belong to the PAYROLL process group, or something similar.

When you create a process permission list, you add the appropriate process groups so that a user belonging to a particular role can invoke the proper batch programs to complete their business transactions. You do this using the Process Group Permission page.

You use the Process Profile Permission page to specify when a user or role can modify certain PeopleSoft Process Scheduler settings.

Note. The Process Profile is granted to the user by way of the user profile, and the Process Group is granted to the user by way of a permission list.

**Process Group Permissions**

Access the Process Groups page.

This page lists the process groups associated with a permission list. Process groups are collections of process definitions that you create using PeopleSoft Process Scheduler.

Typically, you group process definitions according to work groups within your organization, and typically that work group has a particular role associated with it. Regardless of how you organize process definitions, you must assign process groups to a permission list.

Users can run only the processes that belong to process groups assigned to their roles. For example, you may have a set of process definitions that relate to your Human Resources department and another set for your Manufacturing department.

**Process Profile Permissions**

Access the Process Profile Permission page.
You can specify output variables when running processes or jobs on a server. You have the following options:

- **File.**
  
  If the output is going to a file, then specify the directory to which the file should be written. `%%OutputDirectory%%` is a meta-variable that resolves to the output directory that you’ve specified in PSADMIN (or PSPRCS.CFG) for the Process Scheduler Server Agent.

- **Printer.**
  
  Specify the network, or local, printer to which the hardcopy output should be sent. You must explicitly specify the printer; there are no meta-variables available for this value.

### OS/390 Job Controls

**Note.** This group of options applies only to DB2 UDB for z/OS.

All PeopleSoft Process Scheduler shell JCLs use meta-strings to pass data stored in the database. PeopleSoft Process Scheduler takes advantage of meta-strings to generate the JCL job cards based on the user who initiated the request. For example, Job Name and Job Account can be passed by setting the Name and Account values, respectively, on the Process Profile page. For z/OS, you have the following options:

- **Job.**
  
  Enter `%JOBNAME%`

- **Account.**
  
  Enter `%JOBACCT%`
See your RDBMS documentation and the PeopleSoft installation guides for details about JCL meta-variables and strings.

Allow Process Request

These options apply to using PeopleSoft Process Monitor. You can restrict which users are permitted to view or update a given process, based on the user who launched (and owns) the process. You can specify restrictions as follows:

- **View by.**

  Specify who can view processes that are launched by users who have this permission list assigned as their process profile permission list on the User Profile - General page.

  Select from the following options:
  - **Owner:** For a process that’s launched by a user who has this process profile permission list assigned, only the user who launched the process can view it.
  - **All:** All users can view processes that are launched by a user who has this process profile permission list assigned.
  - **None:** No one can view processes that are launched by a user who has this process profile permission list assigned.

- **Update By.**

  Specify who can update the status of processes that are launched by users who have this permission list assigned as their process profile permission list on the User Profile - General page. For example, you decide whether users can restart or cancel a request.

  Select from the following options:
  - **Owner:** For a process that’s launched by a user who has this process profile permission list assigned, only the user who launched the process can update it.
    For example, nobody else can restart a request that this user submitted. However, this user might still be able to update another user’s processes.
  - **All:** All users can update processes that are launched by a user who has this process profile permission list assigned.
  - **None:** No one can update processes that are launched by a user who has this process profile permission list assigned.

  **Note.** Updates are made using the PeopleSoft Process Monitor Process Detail page in the Update Process component.

  Select from the following options:
  - **Owner:** For a process that’s launched by a user who has this process profile permission list assigned, only the user who launched the process can update it.
    For example, nobody else can restart a request that this user submitted. However, this user might still be able to update another user’s processes.
  - **All:** All users can update processes that are launched by a user who has this process profile permission list assigned.
  - **None:** No one can update processes that are launched by a user who has this process profile permission list assigned.

  **Note.** Be careful as you grant update authority to submitted processes. An inexperienced user can easily disrupt batch processing by deleting or holding processes. This is especially true with restarting processes. If a program is not coded for a restart, then users should not be able to restart it. Restarting a program that is not properly coded to acknowledge the previous program run can threaten data integrity. Remember, the process profile permissions are based on the profile of the user who is submitting the process, not the user viewing the process monitor.
The Allow Requestor To options apply to using PeopleSoft Process Monitor and PeopleSoft Process Scheduler Request pages. These options enable you to restrict the authority that a user has while monitoring scheduled processes.

**Override Output Destination**
Select to allow a user to change the value in the Output Destination column on the Process Scheduler Request page.

**Override Server Parameters**
Select to enable users to select the server name and modify the run date/time group on the Process Scheduler Request page.

**View Server Status**
Select to enable users to access the Server List page in PeopleSoft Process Monitor.

**Update Server Status**
Select to allow a user to suspend, restart, or bring down a server using the Server Detail page from the server list in PeopleSoft Process Monitor.

**Enable Recurrence Selection**
Select to enable a run recurrence value for processes and jobs scheduled to run on the server.

---

**Setting Sign-in Time Permissions**

Access the Permission Lists - Sign-on Times page.

<table>
<thead>
<tr>
<th>Day</th>
<th>Start</th>
<th>Time</th>
<th>End</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sunday</td>

<td>00</td>
<td>23</td>
<td>59</td>
<td>+</td>
</tr>
</tbody>
</table>

Permission Lists - Sign-on Times page

Pick a day and set a sign-in duration.

Sign-in times use the 24-hour clock and run through the end time value. For example, a user with an end time of 16:30 can use the system until 4:31 p.m.

To create a sign-in time that spans multiple days, use adjoining sign-in times. For example, to create a sign-in time running from 8 p.m. Tuesday to 6 a.m. Wednesday, you need a Tuesday start time of 20:00 and end time of 23:59. Then you need to add a Wednesday sign-in time with a start time of 0:00 and an end time of 5:59.
By default, all start times are 0:00 and end times are 23:59, and all days are listed. Delete days and change the times to restrict access.

A single day can have more than one sign-in period as long as the periods don’t overlap. If there are multiple non-overlapping sign-in periods for one day, that day appears once for each period.

### Setting Component Interface Permissions

Access the Permission Lists - Component Interfaces page.

<table>
<thead>
<tr>
<th>Name</th>
<th>Edit</th>
<th>+</th>
<th>-</th>
</tr>
</thead>
<tbody>

<td>+</td>
<td>-</td>
</tr>
<tr>
<td>WF_TIMEOUT_DATA</td>
<td></td>
<td>+</td>
<td>-</td>
</tr>
</tbody>
</table>

The Permission Lists - Component Interfaces page is shown above.

**Name**

Shows the name of the component interface.

**Edit**

Click to access the Component Interface Permissions page and grant access to a particular component interface method.

You grant access to component interfaces similarly to adding page access. Add a new row to insert a component interface into the definition list. You must also grant access to the component interface methods.

After adding a new permission to a component, you must delete the web server cache for users to access the component through the portal. To delete the web server cache, reboot the web server.

**Note.** If more than one JVM services the web server, rebooting the web server only purges the in-memory cache. No procedure exists to specify which JVM receives the request. For this reason, you must reboot all JVMs that service the web server.

### Setting Web Library Permissions

Access the Permission Lists - Web Libraries page.
A web library is a derived/work record whose name starts with WEBLIB_. All PeopleSoft iScripts are embedded in records of this type. An iScript is a specialized PeopleCode function that generates dynamic web content.

Administrators should make sure that users have the proper access to web libraries. For example, the default navigation system for PIA users is implemented using a web library. If users do not have the proper authorization to the web library and its associated scripts, then they won’t have proper access to the system. If users are not authorized for a particular web library or script, then they can’t invoke it.

After you add a web library, you set the access for each script function individually. Invoking an iScript requires the assembly of a URL. Developers assemble the URL using PeopleCode.

### See Also

### Setting Web Services Permissions

The web services offered by the PeopleSoft Integration Broker can be secured at the user ID level through the use of the web services permissions you specify. This applies to external web service requests only, not internal web service requests. Internal requests are those submitted from within your PeopleSoft system by a PeopleSoft user of one of your deployed PeopleSoft applications. External requests are those received from third party systems, such as other applications in your organization or other systems outside your organization sending requests over the internet.
If the user ID and password contained in the web service request has the appropriate permissions, the user can invoke the web service. If the submitted user ID and password fails authentication, then user has no permission to invoke the service. If only a User ID is provided, the PeopleSoft system attempts to verify if the user ID is a valid PeopleSoft user. If the verification fails, the system checks if the request is from a trusted node, then uses the external user ID and password associated with the node from which the request was generated. If the request is not from a trusted node, the system checks the user ID associated with the ANONYMOUS node. How PeopleSoft Integration Broker handles authenticating web service request permissions is discussed in detail in the PeopleSoft Integration Broker PeopleBook.

Access the Permission Lists - Web Services page.

<table>
<thead>
<tr>
<th>Service</th>
<th>Customize</th>
<th>Find</th>
<th>First</th>
<th>Last</th>
<th>Edit</th>
</tr>
</thead>

<td></td>
<td></td>
<td>Edit</td>
</tr>
</tbody>
</table>

Permission Lists - Web Permissions page

Add the web services to which a permission list should have access. Add and remove web services to and from the list using the standard plus and minus buttons.

**Note.** Web service requests contain user IDs. For the web service to be invoked, the submitted user ID must be valid in the PeopleSoft system. For example, the user account cannot be locked, the request must be submitted during the user ID’s valid signon times, and the user ID must have permission to invoke the web service operation.

**Web Services**

<table>
<thead>
<tr>
<th>Service</th>
<th>The name of the web service defined in the PeopleSoft system.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Edit</strong></td>
<td>Click to launch the Web Service Permissions page.</td>
</tr>
<tr>
<td><strong>Full Access (All)</strong></td>
<td>Grants full access to all services listed on the page.</td>

</tbody>
</table>

Enable a particular user personalization option for a permission list.

Category  Displays the category or type of personalization option.

User Option  Displays the internal code name associated with the personalization option.

Description  Displays the text that the users see on the My Personalizations page.

Allow User Option  Select to enable the option for a permission list.

Setting Query Permissions

Access the Permission Lists - Query page.
Chapter 3 Setting Up Permission Lists

The Query page has links to the Permission List Access Groups page, where you can define the records to which the user can have access in PeopleSoft Query, and the Query Profile page, where you can define the query operations that the user can perform.

### Defining Access Groups

Click Access Group Permissions to access the Permission List Access Groups page.

Access groups are nodes in a query tree, which you build with PeopleSoft Tree Manager. After you’ve built a query tree, you give users access to one or more of its access groups. Then they can generate queries on any tables in the access groups accessible to them.

When you open Query Manager, it displays either an access group structure or an alphabetical list of records to which you have access. Access groups enable you to logically organize the record components to control security access within PeopleSoft Query. It is not a physical representation of your database.

You can generate queries on and retrieve information only from the tables whose record definitions are within these access groups. If, for example, you were querying an order table and wanted to display data from a related table (like the customer name rather than the customer code), you must have both tables—the order table and the customer prompt table—in your access groups.

To create new queries, or even to run existing ones, users must have access rights to the record components used in the queries. After you’ve built your query trees, you must grant users access to them. You can grant and restrict access to entire query trees or portions of them through the Access Groups page.
To add an access group to a permission list:

1. Open the permission list and select Query, Access Groups Permissions.
2. Select a tree name.
3. Select the highest access group that the user can access.
   
   The system displays access groups in the selected query tree only.

   The access group that you select should be the highest-level tree group to which this permission list needs access. The Accessible check box is selected by default. For example, users in the ALLPANLS permission list have access to all record components in the EIS_ACCESS_GRP and all access groups below it in the QUERY_TREE_EIS query tree—in other words, to all record components in the tree.

4. (Optional) Clear the Accessible check box.
   
   To grant access to most of the record components in a high-level access group, but restrict access to one of the lower-level groups, you can add a new row for the lower-level access group and clear the Accessible check box. Users can then access all record components within the higher-level group except for those you explicitly made inaccessible.

   **Note.** Because it hinders system performance, don’t clear the Accessible check box for lower-level access groups. To restrict access to record components on a particular branch of a tree, consider creating a new tree for those definitions. Attempting to expand an access group that is not accessible causes all access groups below that access group to be loaded into memory.

5. Save your changes.

   **Note.** When the system loads an access group into memory for the first time, you’ll likely experience a small delay. This delay is the result of a physical database read for each record component that is associated with that access group. For this reason, don’t group a large number of record components into a single access group.

### Defining Query Profiles

Access the Query Profile page.
Chapter 3

Setting Up Permission Lists

Query Profile page

Query profiles specify available query operations. You can give users the right to run queries but not create them, or to create regular queries but not workflow queries, and you can restrict the SQL operations that users can perform. You control these options through the query profile.

Each permission list has its own query profile, and the combination of all permission lists that are assigned to a role determine the total query access for the role. User profiles inherit query access only through the roles that you assign to them.

Note. The first level of security is access to PeopleSoft Query itself. Not every user needs to create queries. You grant access to the Windows client of PeopleSoft Query by selecting the Query Access check box on the PeopleTools page of a permission list. You grant access to PIA-based Query Manager by including the QUERY_MANAGER menu and its related components on the Pages page of a permission list.

You select at least one of the options in the PeopleSoft Query Use section of this page to give users query access.

PeopleSoft Query Use

Select from:

• Only Allowed to run Queries

Select to prevent users from being able to create queries and restrict them from running PeopleSoft Query. The values of the remaining options in this group are irrelevant if you have selected this option.
Note. If you select this option, it only applies to the current permission list. If a user has permission to create public queries through another permission list, then that user can run and create queries against the cumulative set of tables specified through all access groups. For example, assume permission list X has Only Allowed to run queries selected, and is limited to tables A, B, and C. And, assume permission list Y has Allow creation of Public Queries selected, and is limited to tables B, C, and D. If a user ID has both permission list X and Y associated with it through roles, that user can create Public Queries with tables A, B, C, and D.

- Allow creation of Public Queries
  Select to enable users to create public queries.

- Allow creation of Workflow Queries
  Select to enable users to create workflow queries in addition to private queries. A workflow query is used in PeopleSoft Workflow, either as a database agent query or a role query. These queries can circumvent security restrictions; the system doesn’t check access group rights while running the query. To make sure that users can’t bypass the system’s security, clear this check box.

- Maximum Rows Fetched.
  Enter a number to restrict the number of rows retrieved by a query. Some queries can return many data rows. For performance or time considerations, you may want users to view only some of those rows rather than all of them.

**PeopleSoft Query Output**
Select at least one:

- Run.
  PeopleSoft Query displays the query results in a view-only grid control. This option is useful as users are refining their queries.

- Run to Excel.
  PeopleSoft Query passes the query results to Microsoft Excel, where users can analyze the results further.

**Note.** If using PeopleSoft Query in the Microsoft Windows environment, you grant runtime access through PeopleSoft Navigator by selecting at least one of the PeopleSoft Query output options.

**Advanced SQL Options**
Restrict less experienced users from generating complex queries, as such queries can affect system performance.

**Setting Mass Change Permissions**
Mass change operator security controls:

- What mass change templates a user can access to create new definitions.
- Whether a user can run mass change definitions online.
- What mass change definitions a user can open, view, or run.
These definitions must also be based on a template with the same PeopleSoft owner as the user.

**Note.** Users inherit mass change authorizations through their primary permission lists, not through roles.

Before you can use a new template to create definitions, you must have permission to access it.

To modify mass change template permissions:

1. Add or remove templates from the Mass Change Template ID list.
2. Select or clear OK To Execute Online, as needed.
   - When you have enabled the OK To Execute Online option, users with the given primary permission list can run mass change definitions after saving any modifications to the Mass Change Definitions pages.
3. Save your work.

**Viewing When a Permission List Was Last Updated**

Access the Audit page.

View when a permission list was last updated and by whom. You can also view who has made changes to security tables by using the Database Level Auditing feature.

**See Also**

*Enterprise PeopleTools 8.49 PeopleBook: Data Management,* “Employing Database Level Auditing,” Understanding Database Level Auditing
### CHAPTER 4

## Setting Up Roles

This chapter provides an overview of roles and discusses how to:

- Manage roles.
- Define role options.
- Create a NEWUSER role.
- Using the PeopleSoft Administrator role.

### Understanding Roles

Roles are an intermediate object that exist between permission lists and user profiles. Roles aggregate permission lists so that you can arrange permissions into meaningful collections. If you implement dynamic roles, then you can add permissions to users dynamically, which reduces administration tasks.

**Note.** In previous releases, roles were associated with PeopleSoft Workflow. PeopleTools has expanded role definitions to include system permissions. There is only one role definition, and you maintain it within Security.

Role users are the user profiles or users that have membership in a particular role. Users inherit most of their permissions from the roles assigned to the user profile. However, you assign the following permission lists directly to a user profile:

- Data permissions.
  - These are assigned through a primary permissions list or a row security permissions list.
- PeopleSoft Navigator homepage permissions.
- Process profile permissions.

When you assign roles to profiles manually, through the Security pages, these users are called static role users. Other users may obtain membership in a role programmatically. You can run a batch process that runs predefined role rules and assigns roles to user profiles according to these rules. This approach is called dynamic membership, and users who become role users of a particular role programmatically are dynamic role users.

Use dynamic role assignment to make your security system scale to large user populations. If you have thousands of users and need to make every change to a user profile manually, the security administrator becomes a bottleneck.
Managing Roles

This section discusses how to:

• Copy roles.
• Delete roles.
• Remove users from roles.

Copying Roles

To copy a role:

2. On the search page, locate and select the role that you want to copy (clone).
   The Role Save As page appears.
3. On the Role Save As page, enter a new name in the as: edit box.
4. Click Save.

Deleting Roles

To delete a role:

2. On the search page, locate and select the role that to delete.
   The Delete Permission List page appears.
3. Click Delete Permission List.
4. Click OK to confirm the deletion, or click Cancel to cancel the deletion.

Note. If you attempt to delete a role definition that is currently in use by one or more static or dynamic role users, you must confirm deletion of the role definition. When you confirm, you remove all references to the role.

Removing Users From Roles

To delete the users assigned to a dynamic role, use the NO_USERS query to locate the users. You invoke this query using the query rule with dynamic roles.

Chapter 4, “Setting Up Roles,” Displaying Dynamic Role Members, page 55

Defining Role Options

This section discusses how to:
• Assign permissions to roles.
• Display static role members.
• Display dynamic role members.
• Set user routing options.
• Decentralize role administration.
• Display additional links for user profiles.
• Run role queries.
• View when a role was last updated.

</tbody>
</table>

Assigning Permissions to Roles

Access the Permission Lists page.
Permission Lists page

To add new permission lists to a role, add more rows. Remember that a user's access is determined by the sum of all the permission lists applied to each role to which the user belongs. For instance, suppose you add permission list X and permission list Y to a role. Permission list X has a sign-in time of 8 a.m. to 5 p.m. and permission list Y has a sign-in time of 1 p.m. to 9 p.m. In this scenario, the users assigned to this role can sign in to the system from 8 a.m. to 9 p.m. Always be aware of the contents of each permission list prior to adding it to a role.

View Definition

Click to open the permission list definition and view the options in the permission, to make sure it is suitable for a particular role.

Displaying Static Role Members

Access the Members page.

Members page

If your database contains more than 1000 role members, this page initially retrieves only the first 1000. You can view the other chunks of 1000 members one chunk at a time, either by searching for a user ID or by using the navigation buttons above the Members grid. With the navigation buttons you can display the first chunk, the previous chunk, the next chunk, or the last chunk.
Chapter 4  Setting Up Roles

User ID  Enter part or all of a role member user ID to search for.

Search  Click to search through the role members for the first chunk of rows that contains the user ID you entered.

View Definition  Click to view the user ID of the role member and make sure that you have selected the appropriate definition for inclusion in the role.

Displaying Dynamic Role Members

Access the Dynamic Members page.

Dynamic Members page

Use this page to set the rule to invoke to assign roles. A dynamic role rule is defined or coded in PeopleSoftQuery, PeopleCode, or your Lightweight Directory Access Protocol (LDAP) directory. A rule can use a combination of PeopleSoft Query and PeopleCode or PeopleSoft Query and LDAP. For the rule to successfully assign a role to the appropriate users, you must select the rule type you have in place for a particular role, and then specify the object that contains the rule you coded.

Note. You must define your role rules before you apply the options on this page. If you change the name of the rule, add a new rule, and so on, save all changes before you run the rule.

If your database contains more than 1000 dynamic role members, this page initially retrieves only the first 1000. You can view the other chunks of 1000 dynamic members one chunk at a time, either by searching for a user ID or by using the navigation buttons above the Dynamic Members grid. With the navigation buttons you can display the first chunk, the previous chunk, the next chunk, or the last chunk.

User ID  Enter part or all of a role member user ID to search for.

Search  Click to search through the role members for the first chunk of rows that contains the user ID you entered.

View Definition  Click to view the user ID of the role member to ensure that you have selected the appropriate definition for inclusion in the role.

Query Rule Enabled  Select if you defined your rule with PeopleSoft Query. The Query Rule group box appears below the Rules group box. Use the Query drop-down list box to select the query that contains your role rule.
PeopleCode Rule Enabled  
Select if your rule is a PeopleCode program. The PeopleCode Rule group box appears. Specify the record, field, event, and function associated with your PeopleCode role rule.

Directory Rule Enabled  
Select if your role rule is based on information in your directory server. With a directory-based rule, you must assign directory groups. The PeopleCode Rule group box appears because directory rules are implemented using the DynRoleMembers PeopleCode program. This program uses the Directory business interlink to retrieve user and group information from the directory. To view the program, open the FUNCLIB_LDAP record in PeopleSoft Application Designer. Click Assign Directory Groups to select a particular directory group that exists in your LDAP server hierarchy. For example, if you have your LDAP server grouped by geographic region, your rule could assign a new self-service role to all users in the North America group. Use the Directory Group drop-down list box to select the appropriate directory group value. The values are derived from the LDAP data that you import using the Directory Group Import process.

Execute on Server  
Select the appropriate PeopleSoft Process Scheduler server to run the rule.

Refresh  
After you run a rule, click to repopulate the grid with updated information.

Process Monitor  
Because the role rules are executed by an application engine program that runs through PeopleSoft Process Scheduler, click to view the status of the program run.

Service Monitor  
Click to check the status of the role rule program. After the program runs, it publishes a message containing the list of users in the role, and then exits. The program does not update any tables; the message (subscription PeopleCode) performs the actual database updates. Just because the dynamic roles program completed successfully, that does not necessarily mean your roles are updated. The associated message must also be delivered successfully.

Note. To clear all dynamic users from the role, run the delivered NO_USERS query.

Query Rule Example

This section describes the process of creating a PeopleSoft Query rule that assigns dynamic role membership. This example should also help to illustrate similar techniques that you would use for a PeopleCode or LDAP rule.

Note. The following text assumes a working knowledge of PeopleSoft Query.

In this example, we need to find all users that currently have job code KC012 (Human Resource Analyst), and add them to the appropriate role.

To create this rule:

1. Create a view.
2. Create the query.
3. Run the dynamic rule.
Note. The Dynamic Role functionality is not designed to resolve bind variables. When you select a query with a bind variable as a dynamic role rule, the system issues an error. Do not use queries with bind variables as a query rule for dynamic roles. Many of the delivered queries are intended to be used with PeopleSoft Workflow, and many of them contain bind variables. These queries are not designed to work as role rules, but you can modify them to do so.

Note. To create a role query based on PSOPRALIAS and avoid issues with row-level security, use PSOPRALIAS_VW instead. This view must be manually synchronized with PSOPRALIAS.

Note. If the query returns duplicate user IDs, dynamic roles will fail on the insert into PSROLEUSER and may have mixed results. Adding a DISTINCT clause to your query role rule to return unique IDs is recommended, especially when your query involves thousands of user IDs.

The view definition for the example role rule might be:

<table>
<thead>
<tr>
<th>Num</th>
<th>Field Name</th>
<th>Type</th>
<th>Key</th>
<th>Ordr</th>
<th>Dir</th>
<th>Cur</th>
<th>Src</th>
<th>List</th>
<th>Sys</th>
<th>Audt</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>EMPLID</td>
<td>Char</td>
<td>Key</td>
<td>1</td>
<td>Asc</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>EMPL_RCD</td>
<td>Nbr</td>
<td>Key</td>
<td>2</td>
<td>Asc</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>EFFDT</td>
<td>Date</td>
<td>Key</td>
<td>3</td>
<td>Desc</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>%date</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>EFFSEQ</td>
<td>Nbr</td>
<td>Key</td>
<td>4</td>
<td>Asc</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>OPRID</td>
<td>Char</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The associated SQL object is:

```
SELECT B.EMPLID, B.EMPL_RCD, B.EFFDT, B.EFFSEQ, A.OPRID
FROM PSOPRALIAS A, PS_JOB B
WHERE A.EMPLID = B.EMPLID
```

Note. The OPRID must not be a key in this view because PeopleTools appends AND OPRID = “current users oprid” in PeopleSoft Query. This occurs if we use the record OPRALIAS directly in the query.

The SQL is:
After you create the view, you add it to the appropriate query tree. In this case, you add the new view to the QUERY_TREE_HR:

![Adding the view to a query tree](image.png)

After you create the view, you create a query. In this example, the properties assigned to the query enable it to assign a role to users who currently have the job code KC012, Human Resource Analyst. This screen shows the query properties:

```
SELECT A.OPRID, A.EMPLID
FROM PSOPRALLAS A
WHERE A.OPRID = 'PS'
```
Chapter 4  Setting Up Roles

Query definition

The query contains the following criteria:

<table>
<thead>
<tr>
<th>Logical</th>
<th>Expression 1</th>
<th>Operator</th>
<th>Expression 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.EFFDT - Effective Date</td>
<td>Expr Date &lt;=</td>
<td>Current Dt [EffSeq = Last]</td>
<td></td>
</tr>
<tr>
<td>AND</td>
<td>A.EMPLID - EmpID</td>
<td>equal to</td>
<td>B.EMPLID - EmpID</td>
</tr>
<tr>
<td>AND</td>
<td>A.EMPL_RCD - EmpL Rcd Nbr</td>
<td>equal to</td>
<td>B.EMPL_RCD - EmpL Rcd Nbr</td>
</tr>
<tr>
<td>AND</td>
<td>B.EFFDT - Effective Date</td>
<td>equal to</td>
<td>A.EFFDT - Effective Date</td>
</tr>
<tr>
<td>AND</td>
<td>B.EFFSEQ - Effective Sequence</td>
<td>equal to</td>
<td>A.EFFSEQ - Effective Sequence</td>
</tr>
<tr>
<td>AND</td>
<td>B.SECOND_JOBCODE - Job Code</td>
<td>equal to</td>
<td>SHARE</td>
</tr>
<tr>
<td>AND</td>
<td>B.JOBCODE - Job Code</td>
<td>equal to</td>
<td>KC012</td>
</tr>
</tbody>
</table>

Query criteria

The SQL for the query is:

```sql
SELECT A.OPRID, A.EMPLID
FROM PS.OPRID_JOB_VW A, PS_JOB B, PS.EMPLMT_SRCH_QRY E1
WHERE B.EMPLID = B1.EMPLID
AND B.EMPL_RCD = B1.EMPL_RCD
AND A.EFFDT = (SELECT MAX(A.ED.EFFDT) FROM PS.OPRID_JOB_VW A.ED
WHERE A.EMPLID = A.ED.EMPLID
AND A.EMPL_RCD = A.ED.EMPL_RCD
AND A.ED.EFFDT <= SUBSTRING(CONVERT(CHAR,GETDATE()/(1000)),1,10))
AND A.EFFSEQ = (SELECT MAX(A.ES.EFFSEQ) FROM PS.OPRID_JOB_VW A.ES
WHERE A.EMPLID = A.ES.EMPLID
AND A.EMPL_RCD = A.ES.EMPL_RCD
AND A.EFFDT = A.ES.EFFDT)
AND A.EMPLID = B.EMPLID
AND A.EMPL_RCD = B.EMPL_RCD
AND A.EFFDT = A.EFFDT
AND B.EFFSEQ = A.EFFSEQ
AND B.SECOND_JOBCODE = 'SHARE'
AND B.JOBCODE = 'KC012')
```

Query SQL

Because the view doesn’t have OPRID as a key, the resulting SQL does not contain the extra line `AND B.OPRID = PS`.

**Note.** When you save a query used for a dynamic role query, you need to specify that it’s a role query.
With the view and the query created, you then set up the query rule on the Roles - Dynamic Members page. Select Query Rule Enabled and select the query in the Query field.

After enabling the query rule, test the rule to make sure the system assigns the appropriate roles to the appropriate users. To populate the role membership table, click Execute Rule.

### Setting User Routing Options

Access the Workflow page.

<table>
<thead>
<tr>
<th>General</th>
<th>ID</th>
<th>Roles</th>
<th>Workflow</th>
<th>Audit</th>
<th>Links</th>
<th>User ID Queries</th>
</tr>
</thead>
<tbody>
<tr>
<td>User ID:</td>
<td>GEMGR</td>
<td>Description:</td>
<td>Charles Smith</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Workflow Attributes**

- **Alternate User ID:**
- **From Date:**
- **To Date:**
- **Supervising User ID:**

**Routing Preferences**

- Worklist User
- Email User

**Reassign Work**

- **Reassign Work To:**

Total Pending Worklist Entries: 0

**Workflow page**

**Allow notification**

Select to enable PeopleSoft Workflow notification. Users can notify others of data on a PeopleSoft page through email or worklists.

When components are designed, developers can enable the Notify toolbar on the Component Properties dialog box in PeopleSoft Application Designer. If this option is set for a particular component, then this check box enables security administrators to enable the Notify feature per role.

**Allow Recipient Lookup**

Select to enable role users to browse the database for the email addresses of other users in the PeopleSoft system, which includes vendors, customers, employees, sales leads, and so on. Available only if Allow notification is selected.

**Use Query to Route Workflow**

Select to determine workflow routings by a workflow query. This depends on your workflow scheme.

### Enabling Users to Grant Roles

You use the Role Grant page to assign limited security administration capability to specified users. You designate them as *remote security administrators* by defining roles that they can grant to other users. Because the settings on this page are part of the implementation of *distributed user profiles*, the page is documented along with the Distributed User Profiles component.

Displaying Additional Links for User Profiles

If you have added any links for user profiles in the Security Links component, they appear on the Links page.

See Also

Chapter 1, “Getting Started with Security Administration,” Administering Security from Applications, page 7

Running Role Queries

Use role queries to provide detailed information regarding a role, such as the user IDs and permission lists associated with the role. The available queries are documented on the Role Queries page.

To run a role query:

1. Click the link associated with the query that you want to run.
   This invokes a new browser window.
2. View the information the query returns, or select a download option.
   For downloading, you have the following options:
   • Microsoft Excel spreadsheet.
     Downloads the query results as a Microsoft Excel spreadsheet (.xls) file.
   • CSV text file.
     Downloads the query results as a comma-separated values (.csv) file.

Viewing When a Role Was Last Updated

Access the Audit page.

View when a role was last updated and by whom. You can also view who has made changes to security tables by using the Database Level Auditing feature.

Enterprise PeopleTools 8.49 PeopleBook: Data Management, “Employing Database Level Auditing,” Understanding Database Level Auditing

Creating a NEWUSER Role

When a new user enters the system, and you have implemented dynamic role rules, the user does not belong to any roles until your role rules execute. When you enter a new user into the system, the user has access only to the "public" pages you authorize for the NEWUSER role. When the dynamic role rules execute, the new user becomes a member of the roles that apply based on the user’s employee position.

Note. The NEWUSER role is not a role that PeopleSoft delivers. You can name the role to suit your requirements.

To implement a NEWUSER role:

1. Create your NEWUSER role.
2. Add permission lists to the role so that members of this role have access to the pages that are appropriate for all users within the system, like My Profile and any other areas that are not a threat to your system security.

3. Apply the appropriate roles.

   If you are using dynamic role assignment, you wait until the batch program runs, if you are using static role assignment, you must wait until an administrator manually applies the appropriate roles.

   If the role rules run only one once in a 24-hour period, it might not be until the next day that a new employee has access to the system. If the rules run more frequently, it may only be a couple of hours. If it’s not acceptable to wait the duration until the next run of the dynamic role rule, you can use one of the following options:

   • Add any "required" pages to one of the permission lists used by the NEWUSER role.
   • Reduce the duration between the dynamic rule execution.

   Note. Reducing the execution interval of the dynamic rules may have performance impacts depending on how the rules are implemented.

   • Add a Signon PeopleCode script that detects that the user needs access to a certain role.

   You can accomplish this by running a query against LDAP, the database, or the location where the information resides. Use the User Profile component interface to add the appropriate roles to the user, according the query results.

---

### Using the PeopleSoft Administrator Role

New to release 8.4 is the PeopleSoft Administrator role. The PeopleSoft Administrator role gives full access to all menus and pages in the PSAUTHITEM table.

The PeopleSoft Administrator role cannot be viewed, edited, modified or cloned because it is not defined as other roles are defined. The PeopleSoft Administrator role is hard coded into every application. You will not find this role if you search for it under roles component.

Note. The PeopleSoft Administrator role does not have any access to data. The data security is given through the Primary and Row level permission lists assigned directly to the user profile.
CHAPTER 5

Administering User Profiles

This chapter provides an overview of user profiles and discusses how to:

• Set up access profiles.
• Work with user profiles.
• Specify user profile attributes.
• Implement distributed user profiles.
• Work with full user profile synchronization.
• Work with passwords.
• Work with user profile options.
• Transfer users between databases.
• Track users’ sign-in and sign-out activity.

Understanding User Profiles

User profiles define individual PeopleSoft users. You define user profiles and then link them to one or more roles. Typically, a user profile must be linked to at least one role to be a usable profile. The majority of values that make up a user profile are inherited from the linked roles.

Note. It’s possible to have a user profile with no roles. This might be a user who isn’t allowed access to the PeopleSoft application; however, you still want workflow-generated email sent to the user.

You define user profiles by entering the appropriate values on the user profile pages. The user profile contains values that are specific to a user, such as a user password, an email address, an employee ID, and so on.

The user ID and description appear at the top of each page to help you recall which user profile you are viewing or modifying as you move through the pages.

Setting Up Access Profiles

This section provides an overview of access profiles and discusses how to:

• Use the Access Profiles dialog box.
• Set access profile properties.
• Work with access profiles.
Understanding Access Profiles

Every user profile must be assigned to an access profile, by way of a Symbolic ID. The Access ID consists of an RDBMS ID and a password, and these IDs must have system administrator privileges. Access profiles provide the necessary IDs and passwords for the behind-the-scenes database logon that occurs. Access IDs are used in the following situations:

- When an application server initializes and connects to the PeopleSoft database.
- When a developer or power user signs in to the PeopleSoft database directly (two-tier).
- When batch programs connect to the database.

Users signing in to the system through PeopleSoft Pure Internet Architecture take advantage of the Access ID that the application server used for connecting to the database.

Access profiles enable you to minimize the number of users who need to know system administrator passwords. In fact, only one person needs to know these passwords. That person can create the required access profiles—by providing the necessary passwords, when prompted—and all other security administrators can simply assign users to the pre-defined access profiles. The Access ID and password are encrypted in the database in the PSACCESSPRFL table.

Before you begin creating your user profiles, roles and permission lists, you first need to set up your access profiles on the database. Ultimately, the access profile is the profile that your users use to connect to your PeopleSoft database. Without being associated with an access profile, users can’t sign in, not even with a test ID. This association is by way of the symbolic ID, which is a proxy ID for the Access ID and Access password.

The ID that you use must be defined at the RDBMS level as a valid RDBMS ID possessing system administrator rights. You don’t use PeopleSoft or PeopleTools software to create the RDBMS ID. You need to create it using the utilities and procedures defined by your RDBMS vendor. After you have created the RDBMS ID with system administration authority, then you use the PeopleTools access profiles utility to link your RDBMS ID to the access profile. This is created when you first install your database.

Using the Access Profiles Dialog Box

You manage access profiles using the Access Profiles dialog, which you open from Application Designer by selecting Tools, Miscellaneous Definitions, Access Profiles.
Chapter 5 Administering User Profiles

Access Profiles Dialog Box

- **Close**: Exit this dialog.
- **New**: Create a new access profile definition.
- **Edit**: Edit an existing access profile definition.
- **Delete**: Delete an existing access profile definition.

Setting Access Profile Properties

When you create or modify an Access Profile using the Access Profiles dialog, you need to understand the properties that comprise an access profile. After reading this section, you will be familiar with these properties.

Add Access Profile Dialog Box

- **Symbolic ID**: The Symbolic ID is used as the key to retrieve the encrypted ACCESSID and ACCESSPSWD from PSACCESSPRFL. For initial installation, you should set it equal to the Database Name.

- **Access Profile ID**: The Access Profile ID must be a valid RDBMS ID with system administrator privileges, and the Access Profile ID must match the associated RDBMS ID. The system assumes that the RDBMS ID that you choose is the same as the Access Profile ID.
The Access ID must be a different logon ID than the User ID. There is logic within PeopleTools such that if Access ID = User ID, PeopleTools does not log off and log on again, nor does the system issue a SET CURRENT SQLID = ‘owner ID’.

DB2 Note. In DB2 terminology, Access ID is the primary ID and Owner ID is a secondary Auth ID. If the Access ID does not equal the owner ID, secondary authorization security exists in DB2 to issue a SET CURRENT SQLID command. DB2 will qualify tables (required) with the Owner ID provided by SET CURRENT SQLID statements issued by the PeopleSoft software. If the access ID equals owner ID, the secondary authorization exits are not required. DB2 will qualify the table name with the access ID.

Access Password

The Access Password is the password associated with your RDBMS ID/Access Profile ID and is the password that the Access ID uses to sign in to the database.

Working with Access Profiles

This section discusses the procedures that you complete while adding, modifying, or removing access profiles in your PeopleSoft system.

To create a new access profile definition:

1. In PeopleSoft Application Designer, select Tools, Miscellaneous Definitions, Access Profiles.
   The Access Profiles dialog box appears.
2. Click New.
   The Add Access Profile dialog box appears.
   This dialog box prompts you for the Symbolic ID, name, and password of the new access profile.
3. Enter a Symbolic ID.
   The Symbolic ID is used as the key to retrieve the encrypted ACCESSID and ACCESSPSWD from PSACCESSPRFL.
4. Enter an Access Profile ID.
   This ID must be a valid RDBMS ID with system administrator privileges.
5. Enter and confirm a password.
   The access password is the password string for the RDBMS ID/Access Profile ID. The Confirm Password field required and its value must match that of the Access Password field.
6. Click OK.

Note. You should use only one Access ID for your system. Some RDBMS do not permit more than one DB table owner. If you create more than one Access ID it may require further steps to ensure that this ID has the correct rights to ALL PeopleSoft system tables.

To change an Access Profile password:

1. In Application Designer, select Tools, Miscellaneous Definitions, Access Profiles.
   The Access Profiles dialog box appears.
2. In the Access Profiles: list, highlight the profile that you want to modify, and click Edit.
   The Change Access Profile dialog box appears.
This dialog box prompts you for the old password, the new password, and then a confirmation of the new password for the access profile.

3. Enter and confirm the new a password.
   The access password is the password string for the ID. The Confirm Password field is required and its value must match that of the Access Password field.

4. Click OK.

To delete an Access Profile:

   The Access Profiles dialog box appears.
2. Highlight the access profile that you want to remove, and click Delete.
   You are prompted to confirm the deletion.
   Click Yes at the prompt dialog box if you want to delete the selected access profile.

---

**Important!** Make sure you don’t delete the only available Access ID or you will not be able to logon to PeopleSoft software in any capacity.

---

**Working With User Profiles**

This section discusses how to:

- Create a new user profile.
- Copy a user profile.
- Delete a user profile.

**Creating a New User Profile**

To create a new user profile:

1. Select PeopleTools, Security, User Profiles, User Profiles to access the Find Existing Values page.
2. Click Add a New Value.
3. On the Add a New Value page, enter the new user ID in the User ID edit box, and click Add.
   The user ID can contain up to 30 characters. The name that you specify can’t contain any white space, or any of the following characters:
   
   $ : & , < > \ / " [ ] ( )
   
   Also, you can’t create a user ID named **PPLSOFT**; this is a reserved user ID used within PeopleTools.
4. Specify the appropriate values from the pages in the User Profiles component (USERMAINT), and click Save.

**Copying a User Profile**

To copy a user profile:
1. Select PeopleTools, Security, User Profiles, Copy User Profiles to access the Find an Existing Value search page.
2. Select the user ID that you want to copy.
3. On the User Profile Save As page, enter the new user ID, description, and the password that the new user ID should use to sign in to the system.

**Note.** If Copy ID Type Information is not selected, the system does not save the EMPLID value to the PSOPRDEFN table.

### Deleting a User Profile

To delete a user profile:

1. Select PeopleTools, Security, User Profiles, Delete User Profiles to access the Delete User Profile page.
2. Make sure that you have selected the correct user profile.
3. Click Delete User Profile to remove information related to this particular user profile that appears in every security table in the system, PeopleTools, and application tables.

To prevent specific information from being deleted, you can specify tables that the delete user process bypasses.

### Bypassing Tables During the Delete User Profile Process

When you delete a user profile and related information, there might be tables that contain rows of user profile data that you do not want to delete. For example, you may want to retain certain user profile history data. You can select the tables that the process skips.

To bypass tables during the Delete User Profile process:

2. Click the prompt button to select the record name to skip.

**Note.** The prompt displays only records that contain the OPRID field as a key field. The view behind this prompt is the PS_TBLSELECTION_VW.

3. Click the Save button.

### Specifying User Profile Attributes

This section discusses how to:

- Set general user profile attributes.
- Set ID type and attribute value.
- Set roles.
- Specify workflow settings.
- Inquire about user profile audit information.
- Display additional links.
- Run user ID queries.

**Pages Used to Specify User Profile Attributes**

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>General</td>
<td>USER_GENERAL</td>
<td>PeopleTools, Security, User Profiles, User Profiles, General</td>

<td>Run queries about a user profile.</td>
</tr>
</tbody>
</table>

**Setting General User Profile Attributes**

Access the General page.
Logon Information

Account Locked Out? Select this check box to deactivate a user profile for any reason. The user can’t sign in until you have cleared this option.

Note. This check box is also automatically selected by the system if you’re using password controls and the user exceeds the maximum number of failed logon attempts. The administrator needs to manually open the user profile and clear this check box to reinstate the user.

Symbolic ID
Associated with a user’s encrypted access ID and access password. The correct symbolic ID must be entered to retrieve the appropriate access ID and password. This value determines which access ID and password are used to log the user onto the database after the system validates the user’s user ID.

The access ID is required only when a user needs to connect directly to the database (in two-tier). The access ID is not required with the portal or if you use a Lightweight Directory Access Protocol (LDAP) directory server to manage user IDs.

With PeopleSoft Pure Internet Architecture, the application server maintains the connection to the database, so the application server must submit an access ID.

Password and Confirm Password
Enter the password string that the user must supply when signing in. The value in the Confirm Password field must match that in the User Password field. The maximum password length is 32 characters.

Note. These values are required to sign on to the system, but you can save the profile without populating these fields.
Password Expired?

If you are using PeopleSoft password controls, this option enables you to force users to change their passwords in the following situations:

- The first time that a user signs in to PeopleSoft software.
- The next time that a user signs in.
- The first time that a user signs in after the system has emailed the user a randomly generated password.

**Note.** To use this option, you must enable the Password Expires in ‘x’ Days PeopleSoft password control.

User ID Aliases

Enables you to use a fully qualified email ID (email address) as a user ID alias. For example, tom.x.sawyer@oracle.com could be the user ID used to sign in to the system. The maximum character length is 70.

Edit Email Addresses

If a user is part of the workflow system or you have other systems that generate email for users, enter an email address for a user with this link. You can enter multiple email addresses for a user, but one must be selected as the primary email address. The system allows only one email address per type. For example, you can’t enter two home email addresses.

The Email Addresses interface has the following controls:

- Primary Email Account: If you enter multiple email accounts, one must be selected as the primary account.
- Email Type: Select from Blackberry, Business, Home, Other, or Work. The Blackberry email type is used with the Workflow/RIM technology.
- Email Address: Enter the email address in this edit box.

General Attributes

Language Code

The language code on the User Profile page has a limited use. For example, when a user runs a batch job, the system needs to know in which language to generate the reports for the user who submitted the job.

In Pure Internet Architecture, the user’s language preference is based on the selection that the user makes on the signon page.

For Microsoft Windows workstations, the user’s language preference is derived from the Display tab in PeopleSoft Configuration Manager. For the Microsoft Windows environment, the value specified as language code in the user profile acts as a default in case the language code isn’t specified in PeopleSoft Configuration Manager.

Currency Code

If the user deals with international prices, set the currency code to reflect the native or base currency. This enables values to appear in the currency with which the user is familiar.

Default Mobile Page

Select the mobile homepage that should appear after users sign on to their mobile device.
Enable Expert Entry

You can specify that some users, such as your expert or power users, have the option of deferring all processing of the data that they enter. This enables users to reduce the amount of trips to the server for data processing, regardless of how the developer set field deferred or interactive processing. You enable this option in a component in Application Designer, and you specify which users have this option using the Enable Expert Entry check box.

If you want a particular user to be able to specify deferred processing, select the check box. If not, leave the check box clear.

Permission Lists

Navigator Homepage
Associated with PeopleSoft Workflow.

Process Profile
Contains the permissions that a user requires for running batch processes through PeopleSoft Process Scheduler. For example, the process profile is where users are authorized to view output, update run locations, restart processes, and so on.

Note. Only the process profile comes from this permission list, not the list process groups.

Primary and Row Security
The system determines which data permissions to grant a user by examining the primary permission list and row security permission list. Which one is used varies by application and data entity (employee, customer, vendor, business unit, and so on). Consult your application documentation for more detail.

The system also determines mass change (if needed), and definition security permissions from the primary permission list.

Setting ID Type and Attribute Value

Access the ID page.

<table>
<thead>
<tr>

ID Types and Values

<table>
<thead>
<tr>
<th>ID Type:</th>
<th>None</th>
</tr>
</thead>
</table>

Attribute Name | Attribute Value | Description |
|----------------|----------------|-------------|

User Description

Description: PeopleSoft Administrator

Set Description or type in User Description.
ID Types and Values

Select the ID type and attribute value. Separating user profiles by ID type enables you to have multiple categories of user profiles with ID numbers all within a range of 1–1000, for example, and it also enables you to grant data permission by entity (customer, employee, and so on). So when users sign in to your benefits or payroll deductions application, they see only information that applies to them.

A user profile is a set of data about an entity—a user—that interacts with the system. The human resources (HR) system, which keeps track of your employee data, is designed to focus more on your employee user types. On the other hand, your financials system is designed to keep track of customer and supplier user types. ID types enable you to link user types with the records that are most relevant when a user interacts with the system.

The Attribute Value field is where you select the value associated with the attribute name. In this case, the value reflects the employee number, but it could be a customer number or vendor number.

User Description

The User Description section enables you to help identify the user.

Description

You can add a description, such as a name of an individual or an organization, for the user profile.

Set Description

Click this link to populate the edit box with an existing description in the database.

Note. Before you assign a user type to a user, you must create user types.

Setting Roles

Access the Roles page.
<table>
<thead>
<tr>
<th>Role Name</th>
<th>Displays the name of the role added to the user profile.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Displays a description of the role added to the user profile.</td>
</tr>
<tr>
<td>Dynamic</td>
<td>Selected if the system has assigned a particular role dynamically.</td>
</tr>
<tr>
<td>Route Control</td>
<td>For each role assigned to a user, you can specify a route control profile. For example, suppose that you have a role named EXPENSE_REP. If you wanted a particular expense representative to handle all of the expense reports submitted by people who had last names beginning with A, you could assign the user a specific route control profile to send the user reports submitted by individuals with a last name beginning with A.</td>
</tr>
</tbody>
</table>

**View Definition**
Enables you to view the role definition associated with this user profile.

**Dynamic Role Rule**
Use the Dynamic Role Rule options to test and manually carry out business rules for dynamically updating roles and assigning them to user profiles. You design your role rules using Query Manager, PeopleCode, or LDAP directory rules.

<table>
<thead>
<tr>
<th>Execute on Server</th>
<th>Select the Process Scheduler server that should run your role rule.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Rule(s)</td>
<td>Use this button to test the rules and verify if they’re going to produce the desired results for a particular user. None of the roles are actually assigned, but the system provides you a report as to what roles will be assigned when you run the rule.</td>
</tr>
<tr>
<td>Execute Rule(s)</td>
<td>Use this button to run the rules and assign the appropriate roles to a particular user. This is the manual approach. Typically, you implement role rules through PeopleSoft Process Scheduler on a regularly scheduled basis.</td>
</tr>
<tr>
<td>Process Monitor and Message Monitor (service operations monitor)</td>
<td>Enables you to view the status of the process carrying out the role rule and the messages that the process invoked.</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

User ID: QEMGR
Description: Charles Smith

**Workflow Attributes**

**Alternate User ID**
Select an alternate role user to receive routings sent to this role user. Use this option when the role user is temporarily out (for example, on vacation or on leave).

If the edit box contains a role user name, the system automatically forwards new work items for whoever is assigned as the current role user to the alternate role user.

**Note.** The system forwards *new* work items to the alternate role user. It doesn’t reassign items already in the user’s worklist.

**Note.** When applying an alternate user ID in your workflow settings, make note of the fact that the system only sends workflow routings to the immediate alternate user ID. The system does not send routings down multiple levels of alternate user IDs. For example, assume user A specifies user B as the alternate user ID while user A is out of the office. Also assume that user B happens to be out of the office at a time during user A’s absence, and user B specifies user C as an alternate user ID. In this case, the system does not send workflow routings originally intended for user A to user C.

**Note.** The Alternate User ID feature is only intended for and only works in conjunction with the Virtual Approver. For example, it does not work with worklists outside of Virtual Approver, or with TriggerBusinessEvent workflow, or with notifications.

**From Date and To Date**
Enter the date on which the current role user is going to begin and return from a temporary vacancy. This edit box specifies the time period that the alternate user ID is used.
Supervising User ID

Select the user ID of the user’s supervisor from this drop-down list box. The system uses this value when it needs to forward information to the user’s supervisor.

The system uses the PERSONAL_DATA record to determine the user’s supervisor.

Note. If you’re using PeopleSoft Human Capital Management (PeopleSoft HCM) applications, this field shouldn’t appear. If it does, you must set your workflow system defaults.

Routing Preferences

Specify which types of routings this role user can receive. The Routing Preferences box shows the two places where the system can deliver work items: to a worklist or to an email mailbox. If the user doesn’t have access to one or both of these places, clear the check box. For example, if this person isn’t a PeopleSoft user, clear Worklist User.

Reassign Work

Re-assign Work To

Use to reassign pending work for this role user if positions change or a user is temporarily out, such as on leave or on vacation.

If this user has work items waiting (as shown by the Total Pending Worklist Entries in your Workflow interface), select this check box and select the user to whom work items should be forwarded from the drop-down list box. When you save the page, the system reassigns existing worklist entries to the specified user.

Note. If you don’t reassign pending work items, they remain unprocessed.

Total Pending Worklist Entries

Displays worklist items that require a user’s attention.

Inquiring About User Profile Audit Information

The Audit page is a display-only page that enables you to determine:

• When a profile was last updated.
• Who updated the profile.

Displaying Additional Links

If you added links for user profiles in the Security Links component, they appear on the Links page.

See Also

Chapter 1, “Getting Started with Security Administration,” Administering Security from Applications, page 7
Running User ID Queries

User ID queries enable you to run queries that provide detailed information regarding a user profile, such as the permission lists and roles associated with a user profile. The available queries are documented on the page.

To run a user ID query:

1. Click the link associated with the query that you want to run.
   This invokes a new browser window.
2. View the information that the query returns to the new browser window, or select a download option.
   For downloading, you have the following options:
   • Excel Spreadsheet: Downloads the query results as an Excel spreadsheet (.xls) file.
   • CSV Text File (comma-separated values text file): This downloads the query results as a CSV (.csv) file.

Implementing Distributed User Profiles

This section provides an overview of distributed user profiles and discusses how to:

• Define user profile access for remote security administrators.
• Define remote security administrator role grant capability.
• Administer distributed user profiles.

Understanding Distributed User Profiles

As your user population increases in size, it can become impractical for one person to centrally administer all of your system’s user profiles. You can distribute some or all user profile administration tasks by enabling selected users to use the Distributed User Profiles component (USERMAINT_DIST) to control the granting of selected roles to other users.

The pages in the Distributed User Profiles component are identical to the corresponding pages in the User Profiles component, except that its User Roles page doesn’t include links for editing the assigned roles. You can restrict who can use the component, which users they can administer, and what roles they can grant, based on the roles to which they themselves belong. For example, you might specify that users in the Line Manager role can grant the Shipping Clerk role to other users. The effect of this is to designate line managers as remote security administrators who can administer the user profiles of shipping clerks. In addition to granting and managing roles, a remote security administrator can administer all parts of a user profile, including passwords, email addresses, and workflow.

Important! Distributing user profile administration might affect regulatory compliance (for example, Sarbanes Oxley). You are responsible for determining and accounting for any impact of using this feature.

To implement distributed user profiles:

1. Use permission lists and roles to configure security to give your selected remote security administrators access to the Distributed User Profiles component.
Note. The PIA navigation path to this component is PeopleTools, Security, User Profiles, Distributed User Profiles.

2. Use the Set Distributed User Profile Search Record page to define which user profiles can be administered with the Distributed User Profiles component.

3. Use the Role Grant page in the Roles component (ROLEMAINT) to specify which roles your remote security administrators can grant with the Distributed User Profiles component.

Defining User Profile Access for Remote Security Administrators

To define user profile access:

1. Define a search record that returns only the user IDs that you want remote security administrators to be able to administer.

Note. Initially, PSOPRDEFN_SRCH is the default search record for this purpose. You can accept the default and skip this step, but that enables access to every user profile on your system. You’re strongly encouraged to define a search record that’s more restrictive.

2. In a browser, select PeopleTools, Security, User Profiles, Distributed User Setup to access the Set Distributed User Profile Search Record page.

3. In the New Search Record field, select the search record that you defined in step 1, then save.

When remote security administrators access the Distributed User Profiles component, this search record enforces row-level security to restrict the set of user IDs that they can select and administer.

See Also

Defining Remote Security Administrator Role Grant Capability

In a browser, select PeopleTools, Security, Permissions and Roles, Roles, Role Grant to access the Roles - Role Grant page.
Chapter 5 Administering User Profiles

Roles - Role Grant page

You use this page to specify which roles can be granted using the Distributed User Profiles component, and which users can grant them. This page is part of a role definition — you can configure this role to be a remote security administrator, or to be a role that a remote security administrator can grant to users, or both.

**Roles That Can Be Granted By This Role**

By specifying one or more roles for this field, you effectively designate users who belong to this role — and who have access to the Distributed User Profiles component — as remote security administrators. Add rows to enable this role to grant as many roles as appropriate. For example, you might want users that belong to the Shipping Manager role to be able to grant the Shipping Clerk (Temporary) role and the Packing Clerk (Temporary) role to other users.

**Note.** This field is complementary to the Roles That Can Grant This Role field, and propagates its values accordingly. Using the example given, on the Role Grant page for the Shipping Clerk (Temporary) role and the Packing Clerk (Temporary) role, the Roles That Can Grant This Role field now specifies **Shipping Manager**.

**Roles That Can Grant This Role**

By specifying one or more roles for this field, you effectively designate users who belong to those roles — and who have access to the Distributed User Profiles component — as remote security administrators, able to grant this role to users. Add more rows to enable additional roles to grant this role. For example, you might want users that belong to the **Security Administrator** role to be able to grant the Shipping Manager role to other users.

**Note.** This field is complementary to the Roles That Can Be Granted By This Role field, and propagates its values accordingly. Using the example given, on the Role Grant page for the Security Administrator role, the Roles That Can Be Granted By This Role field now specifies **Shipping Manager**.

**View Definition**

Click to view the associated role definition and ensure that you’ve selected the appropriate role to grant or to serve as a remote security administrator.
Administering Distributed User Profiles

In a browser, select PeopleTools, Security, User Profiles, Distributed User Profiles to access the Distributed User Profiles component.

Remote security administrators can fully edit the user profiles that they access through the Distributed User Profiles component, including granting roles.

The users that remote security administrators can administer are determined by the search record you specified on the Set Distributed User Profile Search Record page.

The roles that a given remote security administrator can grant are determined by the selections that you made on the Roles - Role Grant page.

Chapter 5, “Administering User Profiles,” Specifying User Profile Attributes, page 68

Configuring User Profile Synchronization Between Databases

PeopleSoft enables you to synchronize users between databases using the USER_PROFILE service operation.

To set up full user profile synchronization, you access PeopleSoft Integration Broker and configure one database to send user profile data and another database to receive user profile data. Applications accomplish user profile synchronization by using the USER_PROFILE service operation.

When you modify existing or enter new profiles on the sending database, PeopleCode publishes the USER_PROFILE service operation, and sends the data to the receiving database. The receiving database consumes the service operation and updates user profiles with the data from the sending database.

To set up full user profile synchronization, perform these tasks in all participating databases:

1. Configure PeopleSoft Integration Broker.
   See Enterprise PeopleTools 8.49 PeopleBook: PeopleSoft Integration Broker, “Using the Integration Broker Quick Configuration Page”.

2. In PeopleSoft Integration Broker, activate and configure the routings for the appropriate version of the USER_PROFILE service operation.
   See Enterprise PeopleTools 8.49 PeopleBook: PeopleSoft Integration Broker, “Managing Routing Definitions”.

User Profile Synchronization Exceptions

Adding and deleting user profiles on the publishing node cause corresponding changes on the subscribing nodes. Modifying user profiles on the publishing node causes corresponding changes on the subscribing nodes with these exceptions.

- Changes to the primary E-mail Type are ignored if a primary email exists in the subscribing node.
- Changes to a User ID Type are ignored if the user ID type is not valid on the subscribing node. Instead, the subscribing node inserts an ID type of None, provided that the subscribing node does not have a row for None already.
- In general, changes that produce invalid field values in the subscribing node are ignored by the subscribing node.
Chapter 5 Administering User Profiles

**Note.** User Profiles contain sensitive information. Design and implement user profile synchronization across different nodes with special care. As delivered, user synchronization behavior may not be acceptable in all cases.

---

**Working With Passwords**

This section discusses how to:

- Set password controls.
- Change passwords.
- Create email text for forgotten passwords.
- Create hints for forgotten passwords.
- Delete hints for forgotten passwords.
- Set up the site for forgotten passwords.
- Request new passwords.

**Setting Password Controls**

Select PeopleTools, Security, Password Configuration, Password Controls to access the Password Controls page.

### Password Controls

<table>
<thead>
<tr>
<th>Enable Signon PeopleCode</th>
<th>Minimum Length</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum Password Length</td>
</tr>
<tr>
<td>Password Expiration</td>
<td>Character Requirements</td>
</tr>
<tr>
<td></td>
<td>Required Number of Specials</td>
</tr>
<tr>
<td></td>
<td>Required Number of Digits</td>
</tr>
<tr>
<td>Account Lockout</td>
<td>Purge Inactive User Profiles</td>
</tr>
<tr>
<td></td>
<td>after: Days Schedule</td>
</tr>
<tr>
<td>Miscellaneous</td>
<td>Password History</td>
</tr>
<tr>
<td></td>
<td>Number of Passwords to Retain</td>
</tr>
</tbody>
</table>

You use the Password Controls page to set any password restrictions such as duration or minimum length of a password that you might want to impose on your end users. These options apply when you are maintaining your user profiles within PeopleSoft, not within a directory server.
Enable Signon PeopleCode

Select this check box to enable the following PeopleSoft password controls: Age and Account Lockout. The other password controls are not enabled by this box.

If you do not want these password controls, as in you already have a third-party utility that performs equivalent features, clear this check box.

**Note.** If you change the status of the Enable Signon PeopleCode check box, you must restart the application server.

You can extend or customize the controls by modifying the PeopleCode.

Password Expiration

You define a number of days (between 1 and 365) that a password is valid. To do this, select the Password Expires in ‘N’ Days option. Users logging on after a password expires must change their password to log on. If you don’t want the password to expire, then select Password Never Expires. When a password expires the user can’t sign in to the system and is prompted to change it.

If you want to specify a duration in which the system warns users that their password is about to expire, you have the following options:

- If you want to specify a warning period, select Warn for ‘N’ days, and enter the number of days in the edit box.

- If you don’t want any warning period, select Do not warn of expiration.

PeopleSoft delivers a default permission list named PSWDEXPR (Password Expired). When a password expires for a user, the system automatically removes all of the user’s roles and permission lists and temporarily assigns them the PSWDEXPR permission list only.

A user whose password has expired can access only items in the PSWDEXPR permission list, which typically grants access to the Change Password component (CHANGE_PASSWORD) only. For the duration of the session, as in until the user changes the password, the user is restricted solely to the PSWDEXPR permission list.

**Note.** The actual user profile stored in the database is not changed in any way when the password expires. You don’t need to redefine the profile. When the password is changed the system restores the user profile’s previous roles and permission lists.

Account Lockout

This control enables you to lock an account after \( n \) number of failed logon attempts. For example, if you set the Maximum Logon Attempts value to 3, and a user fails three signon attempts, they are automatically locked out of the system. Even if they correctly enter a user ID and password on the fourth attempt, the user is not permitted to logon. This feature reduces the risk of any intruders using brute force to break into your system. It also provides a reminder to users to remember the passwords they chose.

After the account is locked out, a system administrator needs to open the user profile and clear the Account Locked check box manually.

Miscellaneous

The Allow password to match User ID control enables administrators to make sure users don’t use their own user ID as a password. This helps you to prevent hackers from guessing passwords based on a list of employee names.
Chapter 5 Administering User Profiles

Minimum Length

Administrators can opt to set a minimum length for passwords maintained by the PeopleSoft system. If the minimum length is set to 0, the PeopleSoft password controls do not enforce a minimum length on the user’s password. This does not, however, imply that the password can be blank. When you create a new user or a user changes a password, the system checks this value. If it is not zero, the system tests the password to ensure it meets length requirements, and if not, an error message appears.

Character Requirements

Administrators can require a set number of digits or special characters within a password. Special characters refer to symbols such as # and @, and digits refer to numbers (integers), such as 1 or 2.

Here is the list of special characters you can include within a password:

! @ # $ % ^ * ( ) _ = + \ [ ] { } ; / ? . > <

Note. The maximum password length is 32 characters.

Purge Inactive User Profiles

This setting enables you to purge the system of user profiles that have not been used in a specified amount of time. If you maintain user profiles in a directory server, a row is added to the PSOPRDEFN table for the system to access while the user interacts with the system. However, when the user is deleted from the directory server, you must also delete the row in PSOPRDEFN associated with the deleted user profile.

Note. The Application Engine program that performs this operation is named PURGEOLDUSERS.

Password History

This control enables you to define the number of user passwords to retain in the password history table. If the user attempts to reuse a password that is stored in the password history table, the application issues an error and prompts the user to enter a different password.

When the user reaches the maximum number of passwords as indicated in the Number of Passwords to Retain field, the system deletes the oldest password and then stores the current password.

Note. If the password history table contains values and you change the Number of Passwords to Retain field value to 0, the system deletes the all password history for all users.

Changing Passwords

The PeopleSoft system enables users to change their passwords as needed.

To change a PeopleSoft password:

1. From the portal navigation pane, select Change My Password.
2. On the Change Password page, enter the current password in the Current Password edit box.
3. In the New Password edit box, enter the new password.
4. Confirm the new password by entering it again in the Confirm Password edit box.
5. Click Change Password.
Creating Email Text for Forgotten Passwords

Before the system emails a new, randomly generated password for a forgetful user, you want to make sure they are who they claim to be. The Forgotten Password feature enables you to pose a standard question to users requesting a new password to verify the user’s authenticity. If the user enters the appropriate response, then the system automatically emails a new password.

When a user has forgotten a PeopleSoft password, the system sends the user a new password within an email message. You can have numerous password hints, but typically, you send all new passwords using the same email message template. Because of this, PeopleSoft provides a separate page just for composing the standard email text that you use for your template:

Forgot My Password Email Text

Enter the text of the email to be sent with the user’s new password.
Please include the exact string "<<%PASSWORD>>" in the email text.
This will be replaced with the new randomly generated password.

Email Text:

Forgot My Password Email Text page

Add the following text string in the Email Text edit box:

<<%PASSWORD>>

This is where the system inserts the new password. The %PASSWORD variable resolves to the generated value.

Note. You might instruct the user to change the password to something easier to remember after they sign on to the system with the randomly generated password. Only users that have the Allow Password to be Emailed (on the General page) option enabled in a permission list can receive a new password using this feature.

Creating Hints for Forgotten Passwords

Select PeopleTools, Security, User Profile, Forgot My Password Hint to access the Forgot My Password Hint page.
Forgot My Password Hint

Password Question ID: DOG

Active ✔

*Question: What is the name of your dog?

Forgot My Password Hint page

With these hints set up, users, upon forgetting their password, access the Forgot My Password page. The user answers the question correctly and gets a new password sent through your email system.

To create a forgotten password hint:
1. Click Add a New Value.
2. On the Add a New Value page, enter a three-character ID in the Password Hint ID edit box.
3. Click Add.
4. Select the Active check box.
5. Enter your question to verify that the user is who he or she claims to be.
6. Click Save.

Deleting Hints for Forgotten Passwords

To delete a password hint:
1. Select PeopleTools, Security, User Profiles, Delete Forgotten Password Hint.
2. Enter the specific code for the hint or perform a search for it.
3. On the Delete Forgot My Password Hint page, select the appropriate hint.
4. Click Delete.

Setting Up the Site for Forgotten Passwords

PeopleSoft recommends setting up a site specifically designed for users who have forgotten their passwords. This site would require no password to enter, but provides access only to the forgotten password pages.

To set up a forgotten password site:
1. Set up a separate Pure Internet Architecture site on your web server.
2. Set up a direct connection to the site, as in a link that leads right to it.
3. In the web profile, enable public access and specify a public user ID and password for automatic authentication.
   This “direct” user should have limited access, as in only to the Email New Password component. Users go directly to it, and get a new password mailed.
4. Place a link to the forgotten password site within the public portion of the PeopleSoft portal, or on another public website.
5. Notify your user community of the link.

**Requesting New Passwords**

To request a new password, direct the user to the Forgot My Password page (EMAIL_PSWD2), which is a hidden page. The system randomly generates a new password and emails it to the user.

Before the system can email the user a new password, complete these tasks:

- Create a forgotten password hint.
- Specify an email address in the user profile.
- Grant permission to have a new password emailed.

**Note.** The security administrator must select the Allow Password to be Emailed check box in at least one of the user’s permission lists. If this setting is not selected, the user is not allowed to receive the new password through email. If the user is allowed to receive new passwords through email, the user can request a new password.

To request a new password:

1. Click the Forgotten Password link on the PeopleSoft signon page (or direct the user to the Forgotten Password link.)
2. On the Forgot My Password page, enter your user ID.
3. Click Continue.
4. On the Email New Password page, verify that the system is set to send the new password to the appropriate email address.

If the appropriate email address does not appear, contact your system administrator. System administrators must make sure that the email address is correctly represented for each user who intends to use this feature.

**Note.** Use Application Designer to change any display properties of the fields on the EMAIL_PSWD2 page.

5. Respond to the user validation question.
6. Click Email New Password.

---

**Working With User Profile Options**

This section provides an overview of user profile types and discusses how to:

- Define user profile types.
- Preserve historical profile data.
Understanding User Profile Types

When deploying your applications to the internet, you have the potential to generate thousands of different user profiles. In some situations, it may be necessary to aggregate your user profiles in a categorical fashion. For example, having ID types enables you to have employee ID numbers beginning at 1 as well as customer ID numbers beginning at 1.

User profile types also provide a means to link user profiles with data stored in application specific records. PeopleSoft applications need this link mostly for self-service transactions. For example, you want employees to see just their own benefits, or you want customers to view and pay their own bills. Customer ID, Employee ID, and so on are the keys for the application data. User profile types enable the system to find the correct ID based on the user profile. The system needs the value because there’s no guarantee that personal data and vendor contact data won’t have the same key field. Because the personal data and vendor contact data resides in different records, there’s no edit that prevents the two records from having the same key.

PeopleSoft delivers the following profile types:

<table>
<thead>
<tr>
<th>ID Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BID</td>
<td>Bidder</td>
</tr>
<tr>
<td>CNT</td>
<td>Customer Contact</td>
</tr>
<tr>
<td>CST</td>
<td>Customer</td>
</tr>
<tr>
<td>EJA</td>
<td>External Job Applicant</td>
</tr>
<tr>
<td>EMP</td>
<td>Employee</td>
</tr>
<tr>
<td>NON</td>
<td>None</td>
</tr>
<tr>
<td>ORG</td>
<td>Organization ID</td>
</tr>
<tr>
<td>PER</td>
<td>Person (CRM)</td>
</tr>
<tr>
<td>VND</td>
<td>Vendor</td>
</tr>
<tr>
<td>PTN</td>
<td>Partner</td>
</tr>
</tbody>
</table>

Defining User Profile Types

Select PeopleTools, Security, Security Objects, User Profile Types to access the User Profile Types page.
**User Profile Types**

<table>
<thead>
<tr>
<th>ID Type</th>
<th>Description</th>
<th>ID Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNT</td>
<td>Customer Contact</td>
<td>□ Enabled?</td>
<td></td>
</tr>
<tr>
<td><em>Description</em></td>
<td>Customer Contact</td>
<td></td>
<td></td>
</tr>
<tr>
<td><em>Sequence number</em></td>
<td>3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**ID Type**

The ID type is the abbreviated form of the profile type name.

**Description**

The Description edit box enables you to add an intuitive name for a profile type. This is the value that appears on the ID Page in the User Profiles component. There’s a 30-character limit.

**Enabled?**

You disable and enable a profile type by selecting this check box. Once enabled, you can assign it to user profiles. If it is disabled then it does not appear in the drop-down list box on the ID page for user profiles.

**Note.** Don’t enable the ID type until the fields and tables in the Field Information section have been defined and built with Application Designer.

**Sequence Number**

This option is used by the Set Description function. On the User Profiles, ID page you can click a Set Description link to generate the user description based on the values in the Description field name for the user types assigned to the user. The sequence number determines which user type to use when the user is assigned to multiple user types. The user description is set to the value in the Description field name of the user type with the lowest sequence number and nonblank value. For example, if a user is assigned to user types of Employee (seq no 1) and Customer Contact (seq no 3), the description would be set to PERSONAL_DATA.NAME, unless it is blank. If PERSONAL_DATA.NAME is blank, the description would be set to CONTACT.NAME1.

**Note.** For user types with multiple fields, the system uses the Description field name corresponding to the last field. For example, the Customer Contact user type has two fields: SETID and CONTACT_ID. The Set User Description function uses the Description field name CONTACT.NAME1 corresponding to the last field, CONTACT_ID.

**Description (Long)**

The Description edit box provides an opportunity to provide details about a given profile type. There’s a 250-character limit.
Field Information

The fields that you select enable the User Profiles component to prompt for an ID value when you select a type on the ID page. Let’s say that the user selects Employee from the ID page. In this case, the system needs to know the valid ID values to prompt the user with. The Edit Table column specifies the record, the Field Name column specifies the field. You can specify multiple fields if the ID has multiple keys, as in when the keys for customer information are Customer ID and SETID.

Preserving Historical Profile Data

There are many occasions when you need to delete a user profile from your system. For example, perhaps an employee retires or an employee leaves the organization. Regardless of the situation, you don’t want to keep the unnecessary user data in your system. It’s a good idea to purge your system of obsolete user data, such as personal queries, to reclaim space for new user data. This process targets all tables that are keyed by user ID.

However, in the case of an employee, you may not want to keep their page or signon access information in the system, but you might be interested in keeping user data stored in an audit table that tracks changes made to vital company data. You may need to check that information a few months later as you might discover some interesting financial allocations, and if so, you’ll want to know who’s responsible.

Note. Keep in mind that the automated process of deleting a user profile deletes every row of data in your system associated with a particular user profile. You want to make sure that any information you might need in the future is safe.

Select PeopleTools, Security, Security Objects, Tables to Skip to access the Bypass Tables page.

To preserve a table that stores data associated with user profiles, add a row to the Bypass Tables page and select either a PeopleTools security table or a PeopleSoft application security table from the Record (Table) Name drop-down list box.

Transferring Users Between Databases

You’ll occasionally need to copy security information from one database to another. Typically, you’ll do this as part of an upgrade or to transfer security information from your production environment to your development or testing environment. PeopleTools provides a set of Data Mover (DMS) scripts designed to export and import your security information. The provided scripts transfer user profiles from a source to a target database.

Note. Application Designer’s upgrade feature offers upgrade support for both Roles and permission lists.

There is one script to export User Profile data from the source database. The source database refers to the database that contains the User Profiles that you want to migrate. The target database refers to the database to which you are copying the user information.

After exporting the security information from the source database, you then run the import script against the target database. The target database refers to the database to which you want to transfer the security data. The scripts involved in transferring security information from one database to another appear in the following list:

- USEREXPORT.DMS. Exports User Profiles from the source database and stores them in a Data Mover DAT file. The output file is named USEREXPORT.DAT.
- USERIMPORT.DMS. Reads the file created by USEREXPORT.DMS and copies the User Profile data into the target database.
You will find this set of scripts in $PS_HOME/scripts.

This section describes the procedure for running these scripts, and it outlines what needs to be in place prior to running the scripts. It also presents some items to consider prior to running the scripts.

**Considerations**

Before running scripts to export and import your security information, you should consider these topics:

- **Duplicate Rows**
  
  If the target database already contains a row of data with identical keys to a row transferred by the import script, the duplicate row *will not* be transferred to the target. The scripts make no attempt to merge the duplicate row; the row is not transferred.
  
  To ensure that you don’t have data rows with duplicate keys, you need to make sure that there’s not a User Profile in the source database with the same name in the target database.
  
  You should not have data rows with duplicate keys in your source and target database when you begin the copy as this can lead to unexpected results which compromise database integrity.

- **Release Levels**
  
  Because the PeopleTools table structures change between major releases (6.X to 7.X or 7.X to 8.X), you can’t transfer users between databases that run different versions of PeopleTools. Before starting the migration process, upgrade your source and target database so the release levels match.

**Running the Scripts**

Complete the following procedure to run the user transfer scripts.

To run the scripts

1. Using Data Mover, sign on to the source database and run USEREXPORT.DMS for user definitions.
   
   You can edit this script to specify the location and file name of the output file and the log file.

2. Using Data Mover, sign on to the target database and run USERIMPORT.DMS for user definitions.
   
   You can edit the script to specify the location and file name of the input file and the log file. The name and location of the input file must match the output file you specified in step 2.

3. After copying user and role definitions, it is recommended that you run the PeopleTools audits.
   
   This includes DDDAUDIT and SYSAUDIT to check the consistency of your database.

---

**Tracking User Sign-in and Sign-out Activity**

PeopleSoft Security provides two audit logs which track users’ sign-in and sign-out activity in PeopleSoft. Signin activity includes timeouts, browser closings, and browser freezes.

Access these logs by navigating in a browser to PeopleTools, Security, Common Queries, Access Log Queries. Select one of the following logs:

- **Access Activity by User**
  
  View a single user’s sign-in and sign-out activity. This log includes a user’s Client IP address, sign-in times and sign-out times.

- **Access Activity by Day**
View one or more days of all user sign-in and sign-out activity. This log includes User IDs, Client IP addresses, sign-in times and sign-out times.

These logs are generated using data from the PSACCESSLOG table. If you are not interested in employing this functionality, delete the PSACCESSLOG table. Deleting this table does not cause any negative impact.

**Note.** If you deleted the PSACCESSLOG table and would like to track Users’ sign-in and sign-out activity again, you must recreate the table using the same exact column names and order as were in the previous PSACCESSLOG table: OPRID, LOGIPADDRESS, LOGINDTTM, LOGOUTDTTM.

---

**Purging Inactive User Profiles**

The Purge Inactive User Profiles page enables you to purge inactive users from your system. To access this page use the following navigation options:

- Select PeopleTools, Security, User Profiles, Purge Inactive User Profiles.
- Select PeopleTools, Security, Password Configuration, Password Controls, and click Schedule under Purge Inactive User Profiles.

**Note.** Before accessing this page you will need to enter a run control ID.

This page enables you to launch automatically the PURGEOLDUSRS Application Engine program. The PURGEOLDUSRS program deletes user profiles having an inactive status that exceeds the period specified in the Purge Inactive User Profiles section on the Password Controls page.

The Setup Purge Frequency for Inactive User Profiles link takes you to the Password Controls page where you can enter a period (in days) under Purge Inactive User Profiles.

CHAPTER 6

Employing LDAP Directory Services

This chapter provides an overview of the PeopleSoft Lightweight Directory Access Protocol (LDAP) solution and discusses how to:

• Configure the LDAP directory.
• Cache the directory schema.
• Create authentication maps.
• Create user profile maps.
• Create role membership rules.
• Delete directory configurations.
• Enable signon PeopleCode for LDAP authentication.
• Use LDAP over SSL (LDAPS).
• Set up SSL on the directory (examples).

Note. This chapter assumes you have a working knowledge of LDAP-enabled directory servers.

Understanding the PeopleSoft LDAP Solution

PeopleSoft delivers three technologies that enable you to:

• Authenticate against an LDAP V3 compliant directory server.
• Reuse your existing user profiles stored within LDAP.

The three technologies are:

• Directory Business Interlink, which exposes the LDAP to PeopleCode.
  The system uses it for all communication with the LDAP server process running on a directory server.
• User Profile Component Interface, which exposes the User Profiles component to PeopleCode.
  The system uses it to programmatically manage a local cache of user profiles.
• Signon PeopleCode, which runs when a user signs on to the system—similar to the login scripting of most network systems.
  Signon PeopleCode uses the Directory Business Interlink and the User Profile Component Interface to verify directory-based credentials and programmatically create a local User Profiles cache.

The combination of these three technologies provides a flexible way to configure PeopleSoft for integration with your directory server. No set schema is required in the directory. Instead, you can configure and extend the Signon PeopleCode to work with any schema implemented in your directory server.
The topics in this chapter describe setting up the LDAP integration technology on your site. The tasks assume that there is already an LDAP V3 compliant directory service installed, and that you are intending to import LDAP group values and apply them to PeopleSoft roles.

**Note.** When you enable LDAP authentication, the password column on the PSOPRDEFN record is no longer used. Directory level users are not authenticated against the PSOPRDEFN table; they are authenticated by signon PeopleCode. Because signon PeopleCode only runs on the application server, LDAP authentication requires an application server. That is, LDAP authentication does not work for a two-tier signon.

---

**Using Oracle LDAP Libraries**

In previous releases, LDAP support across all operating systems was provided through LDAP libraries from Sun Microsystems, Inc. Currently, Oracle LDAP libraries are being used on the following operating systems only:

- Linux (SUSE and Red Hat).
- AIX.
- HP-UX PA-RISC.

**Note.** All other operating system platforms continue to use the Sun libraries, and no additional installation or configuration is required.

Oracle LDAP libraries are used on the specified operating systems regardless of the directory server platform (Oracle Internet Directory, Microsoft Active Directory, Sun Directory Server, or Novell eDirectory).

Oracle LDAP libraries are packaged in several ways, however, it is recommended that you obtain the libraries by installing the Oracle Database 10g Client. Even if you are using a different database platform than Oracle (as in, DB2 or Microsoft SQL Server), you will still need the Oracle Client installed so that you have the necessary Oracle LDAP libraries in place for LDAP support. If you’re using secure LDAP, you also need to set up your digital certificates using Oracle Wallet Manager.

**Note.** The instructions in the following sections apply only to the operating systems where the Oracle LDAP libraries are required.

---

**Installing Oracle LDAP Libraries**

This section discusses how to:

- Install the Oracle Client.
- Set permissions for Oracle Home.

**Installing the Oracle Client**

Install Oracle Client on the server on which the PeopleSoft Application Server is installed. You need to install Oracle RDBMS client 9.x or 10.x, using the appropriate documentation for your operating system in the Client Installation Guides section of the following web page:

http://www.oracle.com/pls/db102/homepage

It is recommended to use Oracle Database 10g Client Release 2 (10.2.0.1.0) unless you are using an Oracle 9i database.
If you use the Oracle 9i Client on the AIX operating systems, complete the following steps to create a new libclntsh.a file.

1. Add the following entries into $ORACLE_HOME/ldap/admin/shrept.lst:
   - ldap : ldap_search_ext_s
   - ldap : ldap_set_option
   - ldap: ldap_add_ext_s
   - ldap : ldap_delete_ext_s
   - ldap : ldap_modify_ext_s
   - ldap : ldap_count_references
   - ldap : ldap_first_reference
   - ldap : ldap_next_reference

2. Generate libclntsh.a by executing $ORACLE_HOME/bin/genclnt.

**Setting Permissions for Oracle Home**

$ORACLE_HOME/bin/* and $ORACLE_HOME/lib/* should be set to 755 so that libraries and utilities in these directories can be used.

Read permission is needed for $ORACLE_HOME/ldap and $ORACLE_HOME/nls and all its subdirectories.

Write permission is needed for all log directories under $ORACLE_HOME/ldap/log and $ORACLE_HOME/ldap/admin/LOGS.

**Note.** $ORACLE_HOME represents the location of the Oracle connectivity.

**Set Environment Variables**

The following environment variables need to be set:

export ORACLE_HOME=<directory where Oracle 10GR2 was installed>

For example,

```
export ORACLE_HOME=/products/oracle/10.2.0.1.0-64bit)
```

export LD_LIBRARY_PATH=SLD_LIBRARY_PATH:$ORACLE_HOME/lib

export LIBPATH=$LIBPATH:$ORACLE_HOME/lib

export SHLIB_PATH=$SHLIB_PATH:$ORACLE_HOME/lib

**Note.** For Linux only, add the following: export PATH=$ORACLE_HOME/bin:$PATH. Otherwise the installed /usr/bin/ldapsearch binary will be used.

**Note.** $ORACLE_HOME represents the location of the Oracle connectivity.

**Implementing SSL with Oracle LDAP Libraries**

To set up SSL using Oracle LDAP libraries:
1. Use the Oracle Wallet Manager to create a wallet.
2. Add a CA certificate to the wallet.
3. Modify the SSL_DB setting in the LDAP_BIND and LDAP_SEARCH business interlinks to reflect the path to the wallet. For example, if you have ewallet.p12, the wallet is located in /pathtowallet/ORACLE/WALLET.
4. Modify the SSL_DBPW in the LDAP_BIND and LDAP_SEARCH business interlinks to reflect the wallet password.

Configuring the LDAP Directory

This section provides an overview of LDAP directory configuration and discusses how to:

• Specify network information for LDAP.
• Specify additional connect DNs.
• Install selected PeopleSoft-specific schema extensions.
• Test the connectivity.

Understanding LDAP Directory Configuration

The Configure Directory component (PSDSSETUP) contains four pages that you use for specifying connection information and testing directory server connections.

To enable your PeopleSoft system to successfully connect to your directory server, you must enter the appropriate connection information. This includes the server name (DNS or IP address) and the listening port number. You also must enter the user distinguished name (User DN) and associated password.

The PeopleSoft application server uses the User DN and password to connect to the LDAP server to retrieve user profile information about the specific user signing in to the system. The User DN must reflect a user with the appropriate LDAP browse rights.
Page Name | Object Name | Navigation | Usage
---|---|---|---
Directory Setup | DSDIRSETUP | PeopleTools, Security, Directory, Configure Directory, Directory Setup | Specify the network information of your LDAP directory servers, such as sign-in IDs and passwords.
Additional Connect DN’s | DSSERVERID | PeopleTools, Directory, Configure Directory, Additional Connect DN’s | Specify connect DN’s in addition to the default connect DN specified on the Directory Setup page.
Test Connectivity | DSSRCHRSLT | PeopleTools, Security, Directory, Configure Directory, Test Connectivity | Test the distinguished names and search criteria that you entered on the previous pages of the Configure Directory component and view the results. The system tests the connectivity when you access this page.

### Specifying Network Information for LDAP

Access the Configure Directory - Directory Setup page.

- **Directory ID:** DOC_SERVER
- **Description:** Main Directory
- **Directory Product:** Novell NDS eDirectory
- **Default Connect DN:** cn=admin,o=config
- **Password:** ********
- **LDAP Server:** 207.132.222.22
- **Port:** 389
- **SSL Port:**

**Directory ID**

Identifies the directory connection that you are creating. The directory ID that you enter can identify a specific LDAP server or a collection of LDAP servers depending on how many servers you add in the Server Name section.
Description
Enter a description of the directory connection.

Directory Product
Select your directory product from the list of options.

Default Connect DN (default connect distinguished name)
Displays the default connect DN associated with the directory ID that you entered or selected on the initial search page. The connect DN is the ID that you can use to connect to the directory server. You can enter an alternative connect DN.

Password
Enter the password associated with the directory-based account that appears in the Default Connect DN field.

Note. The password is stored in encrypted form in the database; not even individuals with administration access to the database can view the password.

Server Name
Add LDAP directory servers to a connection list. You can add multiple servers for failover purposes using the plus button. All servers you add must participate in the same directory service.

LDAP Server
Identify a specific LDAP server. You can use the DNS name or you can use IP address dotted notation. For example, either of the following formats is acceptable: ldap12.yourcompany.com or 192.201.185.90.

Port
Enter the port number on which the LDAP server is configured to receive search requests. The standard LDAP port is 389. If you do not specify the correct port, PeopleSoft Directory Interface can’t exchange data with your LDAP server.

SSL Port
If you are implementing SSL, enter the SSL port on the LDAP server.

Specifying Additional Connect DNs
Access the Configure Directory - Additional Connect DN’s page.

Configure Directory - Additional Connect DN’s page

The PeopleSoft application server uses the User DN and password specified on this page to connect to the LDAP server to retrieve user profile information about the specific user signing in to the system. The User DN must reflect a user with the appropriate LDAP browse rights.

Note. You will not see any available schema extensions unless you have installed the PeopleSoft Directory Interface.
### Chapter 6 Employing LDAP Directory Services

#### User DN
Add any DNs that you need in addition to the default connect DN that you entered on the Directory Setup page. The default user ID is most likely an administrative ID. This enables you to set up a more secure user ID for the scope of the mapping.

#### Password
For each additional DN that you enter, add the corresponding password.

## Installing Selected PeopleSoft-Specific Schema Extensions

Access the Configure Directory - Schema Management page.

![Schema Management Page](image-url)

<table>
<thead>
<tr>
<th>Directory ID:</th>
<th>GE_TEST_NOVELL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply PeopleSoft Schema Extensions</td>
<td>Customize</td>
</tr>
<tr>
<td>Apply Type Name</td>
<td>Object Identifier</td>
</tr>
<tr>
<td>□</td>
<td></td>
</tr>
</tbody>
</table>

### Note
Unless you have installed the PeopleSoft Directory Interface product, you might not have any PeopleSoft schema extensions available to you.

### Note
The Schema Management page enables you to add PeopleSoft-delivered object classes and attribute types to your directory. If you add attributes and object classes using the Schema Management page you must also delete them using this page.

#### Apply
Select this check box to apply the selected schema extension type to your directory.

#### Type
Displays the type of schema extension: either *Object Class* or *Attribute Type*.

#### Name
Displays the schema extension name.

#### Object Identifier
Displays the schema extension object identifier. The sequence 1.3.6.1.4.1.2810.20 identifies the object as a PeopleSoft object. The second to last number is either a 1 or a 2. A 1 indicates an object class type and a...
2 indicates an attribute type. The last number indicates the sequence in which the extension was created.

**Revision**
Displays the number of times that the schema extension was revised.

**Details**
Click to display details about the selected schema extension in the Details region at the bottom of the page.

**Select All**
Click to select all the schema extensions to apply to your directory.

**Deselect All**
Click to deselect every schema extension.

**Apply**
Click to apply the selected schema extensions to your directory.

**Details**
When you click a schema extension’s Details button, the system displays the details of that extension. In addition to the object identifier and name, you may also be interested in the Superiors detail, which indicates which extensions are above this one on the hierarchy, if any. Also of interest is the Type detail, which indicates whether the schema extension is a mandatory, optional, or auxiliary extension.

**Schema Cache Information**
For convenience, you can use the Schema Cache Process link to transfer you to the Schema Cache page so that you can invoke the Schema Cache process. Last Update Date/Time and Last Update User ID enable you to monitor the frequency of updates as well as the last administrator to run the process.

**Testing the Connectivity**
Access the Configure Directory - Test Connectivity page.

<table>
<thead>
<tr>
<th>Directory Setup</th>
<th>Additional Connect DN's</th>
<th>Schema Management</th>
<th>Test Connectivity</th>
</tr>
</thead>
</table>

**Running Bind Tests**
Host: 207.135.14.25:389  
DN: cn=admin,c=config  
Result: **SUCCESS**

**Running Search Tests**
Host: 207.135.14.25:389  
Reading RootDSE: **SUCCESS**  
subSchemaSubEntry listed as cn=schema  
Reading Schema: **SUCCESS**

The page displays the results (PASS or FAIL) of the connectivity test. If connectivity fails, modify the connect information on the Directory Setup and Additional Connect DN’s pages.
Caching the Directory Schema

You use the Cache Schema page to specify a directory server and invoke an Application Engine program designed to create a cache in the PeopleSoft database of the directory schema. This enables you to select names of object classes and attribute types when creating security maps.

This section discusses how to create a cache of the directory schema.

Page Used to Cache the Directory Schema

<table>

<td>creating maps for authentication and user profile maintenance.</td>
</tr>
</tbody>
</table>

Creating a Cache of the Directory Schema

Access the Cache Schema page.

![Cache Schema page]

- **Directory ID**: Select the directory ID to identify the directory that the system should connect to and retrieve schema information from.
- **Server Name**: Search for the Process Scheduler server on which the Cache Schema process should run.
- **Cache Schema Now**: Click this button to cache the LDAP schema data to tables within the PeopleSoft database. Typically, you use this option during initial setup and any time that the schema has changed.
- **Process Monitor**: After invoking the process, you can monitor the progress by clicking this link.
Creating Authentication Maps

Use the Authentication page only if you’re implementing directory authentication as opposed to storing authentication information in the PeopleSoft database. You create authentication maps to define mappings to one or more directories that the PeopleSoft system relies on for authenticating users. You can activate multiple authentication maps. Your PeopleSoft LDAP system authenticates users against all active authentication maps.

This section discusses how to define an authentication map.

Page Used to Create Authentication Maps

<table>
<thead>
<tr>

<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>DSSECMAPMAIN</td>
<td>PeopleTools, Security, Directory, Authentication Map</td>
<td>Create a mapping to the directory that the PeopleSoft system relies on for authenticating users.</td>
</tr>
</tbody>
</table>

Defining an Authentication Map

Access the Authentication page.

Status

Activate the authentication map by selecting *Active*. To disable an authentication map, select *Inactive*. 

Authentication page
## Directory Information

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Directory ID</strong></td>
<td>Select the directory ID of the directory that you intend to use for authentication.</td>
</tr>
<tr>
<td><strong>Anonymous Bind</strong></td>
<td>If all directory data required for authentication and user profile maintenance is visible to an anonymous connection, select this check box.</td>
</tr>
<tr>
<td><strong>Use Secure Socket Layer</strong></td>
<td>Select this option if you are implementing an SSL connection between PeopleSoft and the directory. If you didn’t specify a port number for the directory, the system uses the default LDAPS port.</td>
</tr>
<tr>
<td><strong>Connect DN</strong></td>
<td>This value is the default connect DN that you specified on the Directory Setup page. To select one of the DNs specified on the Additional Connect DN’s page, click the search button.</td>
</tr>
</tbody>
</table>

**Note.** If Anonymous Bind is selected, the Connect DN is ignored.

## User Search Information

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Search Base</strong></td>
<td>Enter the root of the directory information tree under which the system should search for user information.</td>
</tr>
</tbody>
</table>
| **Search Scope** | Select the search scope for this search. Values are:  
  *Base*: Not applicable. You should not use Base on the authentication map.  
  *One*: The query searches only the entries one level down from the entry in the Search Base field.  
  *Sub*: The query searches the entire sub tree beneath the search base entry. |
| **Search Attribute** | When a user signs on using LDAP Authentication, the system searches the directory to find the user’s user entry. The search attribute is used to construct the LDAP search filter used in finding the person’s user entry. The value in the Search Attribute field will be entered by the user when the user signs on. Enter the attribute to be returned by the search, such as user ID (uid) or customer ID (cid). |

**Important!** If you specify a different value here than the User ID Attribute value that you plan to specify on the Mandatory User Properties page, users won’t be able to switch to another application from the Go menu in PeopleSoft Windows clients such as Application Designer.

The second application expects to automatically authenticate a user with the value of %SignonUserId, the system variable that contains the value entered by the user in this field. However, the value of the User ID Attribute field is used to populate the OPRID field in PSOPRDEFN. Because the value of OPRID is different from the value of %SignonUserId, the authentication fails with an error message.

Users can still access any PeopleSoft Windows client by launching it directly and signing in using the value of this field as the user ID.

<table>
<thead>
<tr>

<td>Displays the LDAP search filter that the system uses to search the directory for equal entries.</td>
</tr>
</tbody>
</table>
List of Servers

**SeqNum (sequence number)**  Set the order in which the system should access the list of servers for authentication.

**LDAP Server**  Select the name of the LDAP server. Use the plus button to enter additional servers.

---

Creating User Profile Maps

This section provides an overview of user profile options and discusses how to:

- Specify mandatory user properties.
- Specify optional user properties.

Understanding User Profile Options

If you are going to authenticate users with the directory server, a PeopleSoft User Profile is still required. That is, a row is still required in the table in which PeopleSoft user information is stored (PSOPRDEFN). In this context, you cache LDAP user information inside your PeopleSoft system. The properties that you specify on the Mandatory and Optional User Properties pages are the columns in PSOPRDEFN that the system populates with values from your directory server. These values comprise your user profile options.

PeopleSoft applications use this cache of user information, not your directory server. Whenever a transaction requires user information, the application refers to the local PSOPRDEFN table as opposed to querying the directory server. This improves performance.

After a user signs onto the system and the Signon PeopleCode is carried out, PeopleSoft creates a row for that user in the user definition table by retrieving the LDAP information and creating a local cache. Signon PeopleCode maintains this row automatically; there is no need for any manual updates. Any changes made in the directory server are reproduced in the local cache.

Some properties are required when creating a PeopleSoft User Profile; these properties appear on the Mandatory User Properties page. Other properties are optional, and these appear on the Optional User Properties page.

**Note.** You must supply user properties to Signon PeopleCode only if you intend to authenticate users with your LDAP directory.
Pages Used to Create User Profile Maps

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory User Properties</td>
<td>DSUSRPRFLMANMAP</td>
<td>PeopleTools, Security, Directory, User Profile Map, Mandatory User Properties</td>
<td>Specify the attributes required for signon. You can select to have the system retrieve these mandatory values from the directory server, or you can enter default values.</td>
</tr>
<tr>
<td>Optional User Properties</td>
<td>DSUSRPRFLOPTMAP</td>
<td>PeopleTools, Security, Directory, User Profile Map, Optional User Properties</td>
<td>Specify optional user properties to retrieve from the directory.</td>
</tr>
</tbody>
</table>

Specifying Mandatory User Properties

Access the Mandatory User Properties page.

**User Profile Map:** DOC_USER

**Authentication Map:**

Directory ID:

**User ID Attribute:**

**ID Type:**

**ID Type Attribute:** None

**Default Role**

- **Use default Role**
  - Role Name: 
  - Role Attribute:

**Language**

- **Use Default Language Code**
  - Language Code: English
  - LangCD Attribute:

**Authentication Map**

Select the authentication map to associate with this user profile mapping. The server and connection information are taken from the authentication map.

**Status**

Displays the status of the selected user profile map.

**Note.** Only one user profile map should be active at any time.
**Directory ID**
Displays the directory ID associated with the authentication mapping.

**User ID Attribute**
Specify the LDAP attribute that’s used to populate the OPRID (user ID) field on PSOPRDEFN.

---

**Important!** If you specify a different value here than the Search Attribute value that you specified on the Authentication page, users won’t be able to switch to another application from the Go menu in PeopleSoft Windows clients such as Application Designer.

The second application expects to automatically authenticate a user with the value of %SignonUserId, the system variable that contains the user ID that was used to sign in. However, because the value of OPRID is different from the value of %SignonUserId, the authentication fails with an error message.

Users can still access any PeopleSoft Windows client by launching it directly and signing in using the same Search Attribute value for the user ID.

---

**ID Type**

**ID Type**
Enter the default ID type for new users, such as Employee ID, Customer ID, and so on. This field is similar to Symbolic ID.

**ID Type Attribute**
Specifies the LDAP attribute in the directory that holds the selected ID value. For instance, the ID value might be Employee ID. Some ID types require additional data when creating a profile of that type. LDAP User Profile Management can retrieve that data from the LDAP directory if it is available.

---

**Default Role**

**Use Default Role**
Select this option if you want to use the default role. If you enable this option, the Default Role edit box becomes available for entry while the Role Attribute edit box becomes unavailable for entry. You either specify a default role or specify an LDAP attribute on the user entry that holds the valid name of a PeopleSoft Role.

**Role Name**
Enter the name of a default role to be assigned to new users. This value applies to users the first time that they sign on and have not had any roles dynamically assigned to them. Typically, this role has only basic access authorizations, such as for only the self-service pages. Users should get most of their permissions through dynamically assigned roles.

**Role Attribute**
Instead of specifying only a single default role for each and every user, you can enter a value for the LDAP attribute that holds the name of a PeopleSoft role to be assigned to the user.

You can enable your application to automatically apply a role for the user. When signing in to the application, the user provides a value for the search attribute you specified in the authentication map. The system uses that attribute value to search for the user’s entry in the LDAP directory, then imports the group containing the entry to the PSOPRDEFN table as the user’s role.

To enable this automatic role import feature:

1. Define LDAP groups with names that exactly match the roles defined for your application.
2. Clear the Use Default Role check box on this page.

---
3. Leave the Role Name and Role Attribute fields on this page blank.

**Language**

- **Use Default Language Code**: Select if you do not maintain language codes in the directory.
- **Language Code**: If the default language code is not stored in the directory, select a default value from the drop-down list box.
- **LangCD Attribute**: The name of the LDAP attribute containing a valid language code. The value retrieved from the attribute must be a valid PeopleSoft language code.

**Specifying Optional User Properties**

Access the Optional User Properties page.

- **User Profile Property**: Select the user profile property that you want to add to the local cache. These properties are described in the following table.
- **Use Constant Value**: To supply a constant value for each user, select this option.
- **Attribute Name**: Add the name of the attribute as it is represented in your LDAP schema.
- **Constant Value**: Appears only if you have selected Use Constant Value.
- **Always Update**: Select this option if you always want the system to update the local user cache to reflect the data stored in the directory server every time the user signs on. If Always Update is not selected, the data will be taken from the directory only when the profile is first created.

The following are optional user properties that you can select from the User Profile Property search button.

- **Currency Code**: If the user deals with international prices, set the currency code to reflect the native or base currency so that values appear in the currency with which the user is familiar.
- **Email Address**: Select if a user is part of your workflow system or you have other systems that generate emails for users.
- **Multi-Language Enabled**: Select if the user is set up to use PeopleSoft with multiple languages.
- **Navigator Home Page**: The homepage is associated with PeopleSoft Workflow (Navigator Homepage).
- **Primary Permission List**: PeopleSoft determines which data permissions to grant a user by examining the primary permission list and row security permission list. Which one is used varies by application and data entity (employee, customer, vendor, business unit, and so on). Consult your PeopleSoft application documentation for more detail. PeopleSoft also determines mass change and definition security permissions from the primary permission list.
- **Process Profile Permission List**: The process profile contains the permissions that a user requires for running batch processes through PeopleSoft Process Scheduler. For example, the process profile authorizes users to view output, update run locations, restart processes, and so on. Only the process profile comes from this permission list, not the list of process groups.
Row Security Permission List

See explanation for the Primary Permission List field.

Symbolic ID

If the symbolic ID is required for the user, select this option.

User Description

Displays, typically, the name of the user, such as an employee name or a vendor name.

User ID Alias

In some cases, the user ID is an alias in the form of an email address. If so, select this option.

Creating Role Membership Rules

Use the Role Policy page to define the rules that are read by Dynamic Role Rule PeopleCode and populate PeopleSoft roles with members. The rules return the DNs of "people" directory entries, which supply the system with the user IDs specified on the user profile mapping.

This section provides an overview of role membership rules and discusses how to define role membership rules.

Understanding Role Membership Rules

PeopleSoft security roles are comparable to LDAP directory groups. Roles enable you to group user IDs in logical sets that share the same security privileges. PeopleSoft enables you to keep your external directory groups synchronized with the data stored within the PeopleSoft database.

It is important to keep the data within PeopleSoft consistent with any changes made to the structure or content of the external directory server. This is especially crucial when dealing with security data. The Role Membership Rules page enables you to modify a PeopleSoft role based on directory criteria.

Page Used to Create Role Membership Rules

<table>
<thead>
<tr>

<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role Policy</td>
<td>DSSECROLERULE</td>
<td>PeopleTools, Security, Directory, Role Membership Rules</td>
<td>Define the rules that are read by Dynamic Role Rule PeopleCode and populate PeopleSoft roles with members.</td>
</tr>
</tbody>
</table>

Defining Role Membership Rules

Access the Role Policy page.
Chapter 6 Employing LDAP Directory Services

Role Policy page

Rule Name: PTNTLDAP-ALL-USERS
Description: 
User Profile Map: PTNTLDAP-NDS-AUTHZ
Directory ID: PTNTLDAP-NDS

Directory Search Parameters

Search Base: dc=com
Search Scope: Sub

Build Filter

( Attribute Operation Value ) And/Or

Search Filter: objectclass=person

Search Attributes

Directory Attribute:

Directory Search Parameters

Search Base: Enter the entry (or “container”) at which to begin the search.
Search Scope: Select the search scope for this search from the following options:
   Base: The query searches only the value in the Search Base field.
   One: The query searches only the entries one level down from the value in the Search Base field.
   Sub: The query searches the value in the Search Base field and all entries beneath it.
**Build Filter**

( ) Parentheses; on either side of the filter expression select the check boxes below the parentheses to group expressions.

**Attribute** Select the attribute that the system will filter.

**Operation** Assign an operator to your rule, such as <, <=, >=, =, >, or >=.

**Value** Enter the value to assign to the attribute that you specified.

**And/Or** To add another line to your rule, select AND or OR, depending on your rule logic. Select END to signify the end of the search. Select NONE if you aren’t using this kind of filter.

**Refresh Search Filter** After you make changes using the Build Filter options, click this button to update the Search Filter edit box to reflect the changes.

**Clear Search Filter** Click this button to delete all values from the Search Filter edit box and the Build Filter selections.

**Search Filter** The purpose of this field depends on whether you also specify values in the Directory Attribute field, as follows:

- No directory attributes specified. Enter a name=value pair that identifies a key field and value on the user record. The system applies this criterion to search for an individual user, regardless of group membership.

- One or more directory attributes specified. Enter a name=value pair that the system applies to the search for the DN of the defined container or group. This value typically displays the directory object class of the container in the form “objectclass = GroupOfUniqueNames”, for example. This indicates what type of container to search. To retrieve the correct container DNs, the system adds the name of the container to the search filter at runtime.

**Search Attributes**

**Directory Attribute** Select attributes that identify the user to add to this membership. This searches for members only within the group that’s specified by the Search Filter field.

**Note.** You can also write PeopleCode to determine group membership using any arbitrary LDAP search criteria.

---

**Deleting Directory Configurations**

You can delete the entire directory configuration or just parts of it.

This section discusses how to:

- Delete the directory configuration.
- Work with the workflow address book.
Page Used to Delete Directory Configurations

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete Directory</td>
<td>DSPURGEDIRID</td>
<td>PeopleTools, Security, Directory, Delete Directory Configuration</td>
<td>Delete the entire directory configuration or just parts of it.</td>
</tr>
</tbody>
</table>

Deleting the Directory Configuration

Access the Delete Directory page.

![Delete Directory page]

- **Directory ID:** DOC_SERVER
- **Delete Associated Maps**
- **Delete Associated Searches**
- **Delete Associated Role Rules**
- **Delete Associated Entry Rules**

Delete Directory Configuration

After you have made the appropriate choices, click this button to perform the delete process. If you click this button with nothing selected, the system deletes only the directory ID and leaves all of the other configuration information intact.

Working with the Workflow Address Book

Select PeopleTools, Security, Directory, Workflow Address Book to access the Address Book page.

Use the Address Book page for configuring LDAP address lookups for use with user-initiated notifications in PeopleSoft Workflow. This page contains the controls needed to retrieve the necessary addresses from the directory. This page applies only if you store user information in a directory.

**Note.** Each of these controls is discussed elsewhere in this chapter.

Enabling Signon PeopleCode for LDAP Authentication

LDAP Authentication runs as Signon PeopleCode that must be enabled and configured to be carried out with proper permissions.

To enable Signon PeopleCode:

2. Click the Invoke As option that applies to your configuration.
   
   Do you want to use a default user ID, or do you want the Signon PeopleCode to be invoked by the user ID of the user who happens to be signing on to the system? Either way, the value for the user ID and password must be a valid PeopleSoft User ID and password. For LDAP authentication, you need to use Invoke As, because the user signing in (most likely) won’t exist in the local system, until Signon PeopleCode runs and updates the local cache of user profiles.

   Note. The user ID entered—whether it is Invoke as user signing in or a default user—must be able to access the User Profiles component in a permission list.

3. Locate the row for the LDAP_Authentication function on the Record FUNCLIB_LDAP.
4. Select the Enabled check box (if it is not already selected automatically by the system).
5. Ensure that the Exec Auth Fail check box is selected; if PeopleSoft authorization fails, then Signon PeopleCode is carried out.
   
   PeopleSoft authorization always fails if you are using LDAP authentication.
6. Click Save at the bottom of the page.
7. Reboot any application servers running against the local database.

Using LDAP Over SSL (LDAPS)

You can use the LDAP Business Interlink to establish a secure LDAP connection between the application server and the LDAP server. The LDAP Business Interlink uses Netscape’s certificate database, cert7.db. You can obtain a cert7.db using the PKCS Utilities distributed by Netscape. Refer to Netscape’s documentation for more information on obtaining and using the PKCS Utilities.

To establish the secure connection between the PeopleSoft Application Server and the LDAP server you will need the following:

- Cert7.db certificate database from Netscape.
- A Server Certificate for the LDAP server.
• The Trusted Root Certificate from the Certificate Authority (CA) that issues the Server Certificate.

To enable LDAP authentication over SSL:

1. Follow the documentation for your directory server to add the Server Certificate to your directory server.
3. Place the cert7.db file in the %PeopleTools%\bin\server directory of the application server.
4. Select PeopleTools, Security, Directory, Configure Directory, Directory Setup to access the Directory Setup page, and make sure that the SSL Port field reflects the correct LDAPS port for your directory server.
5. Select PeopleTools, Security, Directory, Authentication Map to access the Authentication Map page, and select the Use Secure Sockets Layer check box.
6. In Application Designer, open the following Business Interlinks, select the Settings tab, and change the SSL setting to YES:
   • LDAP_SEARCH
   • LDAP_BIND

---

**Setting Up SSL on the Directory (Examples)**

If you require SSL between your LDAP directory server and your PeopleSoft system, the following topics provide sample procedures for doing so.

This section provides an overview of SSL and the directory and discusses how to:

• Set up SSL for Novell NDS.
• Set up SSL for Netscape (iPlanet).

**Note.** The procedures outlined in this section are provided as samples. They may not necessarily apply to all situations.

**Understanding SSL and the Directory**

SSL is a protocol developed by Netscape that defines an interface for data encryption between network nodes. To establish an SSL-encrypted connection, the nodes must complete the SSL handshake. The simplified steps of the SSL handshake are as follows:

1. Client sends a request to connect.
2. Server responds to the connect request and sends a signed certificate.
3. Client verifies that the certificate signer is in its acceptable certificate authority (CA) list.
4. Client generates a session key to be used for encryption and sends it to the server encrypted with the server’s public key (from the certificate received in step 2).
5. Server uses its private key to decrypt the client generated session key.
Establishing an SSL connection requires two certificates: one containing the public key of the server (server certificate or public key certificate) and another to verify the CA that issued the server certificate (Trusted Root certificate). The server needs to be configured to issue the server certificate when a client requests an SSL connection and the client needs to be configured with the Trusted Root certificate of the CA that issued the server certificate.

The nature of those configurations depends on both the protocol being used and the client and server platforms. In most cases you replace HTTP with LDAP. SSL is a lower level protocol than the application protocol, such as HTTP or LDAP. SSL works the same regardless of the application protocol.

Note. Establishing SSL connections with LDAP (LDAPS) is not related to web server certificates or certificates used with PeopleSoft integration.

**Setting Up SSL for Novell NDS**

This section discusses how to configure the LDAP business interlink to establish SSL encrypted LDAP connections. The LDAP business interlink uses a certificate database that resides on the file system of the PeopleSoft Application Server. The certificate database is a file called cert7.db and needs to reside in the file system of the application server. The cert7.db certificate database needs to contain the Trusted Root certificate of the CA that issued the Server Certificate of the LDAP server.

**Setting Up the Certificate**

To obtain a cert7.db, you must download Netscape Navigator 4.7, install it, and launch Netscape Navigator. Create a user profile with the name of PeopleSoft, and verify that the following directory structure exists:

```
Netscape\Users\PeopleSoft.
```

To import the certificate:

1. In the PeopleSoft directory, find cert7.db.
2. With Netscape Navigator open, click the Security button at the top. The Security Information page appears.
3. Select Certificates and Signers. The system displays the valid certificates in the database.
4. Delete all of the certificates, click OK, and close Netscape Navigator.
5. Import the CA’s certificate into the cert7.db certificate database.

You are ready to configure the LDAP business interlink for SSL. There are two relevant settings on all transactions of the business interlink:

- SSL setting.
- SSL_DB location setting.

As with all business interlink inputs, these can be set using either Application Designer or PeopleCode.

To make the settings using Application Designer:

1. Open an existing instance of the LDAP business interlink, or create a new instance.
2. Select the Settings tab.
3. Set the SSL parameter to *YES*.
4. Set the SSL_DB parameter to the name of your certificate database (cert7.db by default).
5. Save the business interlink.

To make the settings using PeopleCode, drag the business interlink definition into the PeopleCode editor. The following code is created:

```peoplecode
/* ===>
   This is a dynamically generated PeopleCode template to be used only as a helper to the application developer.
   You need to replace all references to '<*>' OR default values with references to PeopleCode variables and/or a Rec.Fields. */

/* ===>
Declare and instantiate: */
Local Interlink &LDAP_SEARCH_1;
Local BIDocs &inDoc;
Local BIDocs &outDoc;
Local boolean &RSLT;
Local number &EXECRSLT;
&LDAP_SEARCH_1 = GetInterlink(INTERLINK.LDAP_SEARCH);

/* ===>
You can use the following assignments to set the configuration parameters. */

&LDAP_SEARCH_1.SSL = "NO";
&LDAP_SEARCH_1.SSL_DB = "cert7.db";
&LDAP_SEARCH_1.URL = "\\file:C:/User/Documentum/XML%20Applications/proddoc⇒/peoplebook_upc/peoplebook_upc.dtd";
&LDAP_SEARCH_1.BIDocValidating = "Off";
```

Note. This example uses the Search transaction, but the same principle applies to any transaction.

You must change the .SSL and .SSL_DB settings to indicate that SSL should be used, and specify the name of your certificate database file. For example:

```peoplecode
&LDAP_SEARCH_1.SSL = "YES";
&LDAP_SEARCH_1.SSL_DB = "cert7.db";
```

### Configuring Your LDAP Server for SSL

This section describes how to configure NDS eDirectory V8.5 for LDAPS using the Organizational CA built into NDS’s PKI services.

To configure NDS eDirectory V8.5 for LDAPS:

1. Export the Self Signed Trusted Root Certificate from the CA.
   a. Start Console1 and navigate to the Organizational CA object in the Security container:
   b. Open the Properties dialog, go to the Certificates tab, and choose Self Signed Certificate from the menu.
   c. Click the Export button.
   d. In the Export a Certificate dialog box, choose binary DER format, designate a file name and location, and click Export.
   e. Rename this file using an .X509 file format.
2. Create a Server Certificate to be used by LDAP.
a. In Console1, navigate to the container that holds the Server Object for the LDAP Server:

b. Right-click the container entry (such as Config), and select NewObject. Scroll down and find NDS PKI:Key Material in the list, and click OK.

c. In the Create Server Certificate dialog box, make sure that the server name is the name of the directory server running the LDAP service.

Also, give the new certificate a meaningful name, select the Standard creation method, and click Next:

d. Review the information in the next dialog box, and click Finish.

You should now have a certificate that contains the public key for the server running the LDAP service stored in your directory as an object:

3. Indicate to the LDAP service which port to use for SSL connections and to issue the certificate when a client requests a connection on that port.

a. Find the object representing your LDAP Server; it’s in the same container where you just created the certificate, and it’s named LDAP Server-\hostname-NDS.

b. Open the properties dialog box on the LDAP Server object, and select the SSL Configuration tab.

c. Enter the port number that you want to use for LDAPS, and in the SSL Certificate field, click the browse button to select the certificate that you just created.

_Don not_ check Enable and Require Mutual Authentication unless you have configured this option (which is outside the scope of this discussion).

**Note.** Under your Novell Install Directory there should be a file called X509.REG. The path should be similar to install_directory\CERTSERV\MISC\X509.REG. Take this file and move it to the machine on which you’ve installed Netscape. From the machine that uses Netscape, run the X509.REG file by double-clicking it. This updates your registry so that Netscape can import the certificate.

4. Import the certificate.

a. Launch Netscape, select File, Open, and enter the file location of the .X509 certificate that you exported from NDS.

b. Netscape will take you through the certificate import process.

Complete the steps in the wizard.

c. To confirm proper installation, click the security tab (the lock), open the security administrator for Netscape, and click the Certificates Signers link, which takes you to all valid certificates in the database.

You should now see the certificate that you imported.

5. Move the cert7.db to the appserv folder.

The system should now be running LDAPS with NDS.

**Note.** You are responsible for receiving certificates from a CA, such as Entrust.Net or Verisign.

**Note.** If you try to test this with the business interlink tester, the error code 89 is often reported. This does not mean that LDAPS is not working. To test, you can run a trace on the directory to see the SSL handshake occurring. You can also turn off port 389 and see if authentication still works. If it does, then this indicates that SSL is working.
Setting Up SSL for Netscape (iPlanet)

To set up SSL on Netscape:

1. Make sure that your directory is defined in the PeopleTools, Security, Directory component.

2. Modify the Signon PeopleCode page:
   b. Select the Invoke as radio button.
   c. Enter the user ID and password of a user who has permission to run the Signon PeopleCode.
      The password will not be visible once the page is saved.
   d. Select the Enabled box to enable the Signon PeopleCode.
   e. Enter the Signon PeopleCode location as shown in the default values.
   f. Select the Exec Auth Fail box, because Signon PeopleCode is triggered when authentication fails against
      the PeopleSoft authentication.
   g. Save the page.

   **Note.** Make sure that the user ID entered above has permission to run the Component Interface
   USER_PROFILE.

3. Modify the LDAP_BIND and LDAP_SEARCH business interlink definitions:
   a. Open Application Designer.
   b. Open the LDAP_BIND definition.
   c. Select the Input tab.
   d. Enter the server name and port for the LDAP server.
      The other parameters are not required for this procedure.
   e. Select the Settings tab.
   f. Select YES from the SSL drop-down list box.
   g. In the SSL_DB edit box, enter the location of the certificate database; for example,
      c:/peoplesoft/certificates.

   **Note.** This field should contain just the directory location, not the database filename.

   h. Click Set Default to save the default settings.
   i. Save and close the definition.

4. Consider the following items:
   a. The application server binds as a client to the LDAP server as part of the authentication, so it is only
      necessary to have access to the Root Certificates.
      The LDAP administrator at your site should have already installed a server (Node) Certificate on the
      LDAP Server.
   b. The cert7.db file can be transferred to the application server in binary mode and installed in the same
      directory as PSAPPSEVR.CFG and PSTUXCFG of the application server domain.
   c. Using a copy of the LDAP server’s cert7.db is not a security risk, as the Node Certificates are encrypted
      strings based on the host name and other site-specific parameters.
The application server accesses the Root Certificates, which are generally available at no charge from the CA.

5. Reboot the application server domain.
This chapter provides an overview of the delivered external authentication solutions and discusses how to:

- Use Signon PeopleCode.
- Use the web server security exit.
- Use the Windows security exit.

Understanding the Delivered External Authentication Solutions

PeopleSoft delivers the most common authentication solutions and packages them with our application for you to use. This saves you the trouble of developing your own solutions and saves you time with your security implementation.

Note. The traditional method, where the user submits signon credentials that the system compares to a row in the PSOPRDEFN table, is a valid means of authentication; however, it is not a recommended method for increased scalability and manageability as you deploy applications to the internet.

The authentication solutions are delivered PeopleCode programs that you can include in your Signon PeopleCode. The following table describes each function that appears on the Signon PeopleCode page:
<table>
<thead>
<tr>
<th>Function</th>
<th>Exec Auth Fail</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WWW_Authentication</td>
<td>Not Required</td>
<td>Applies when you want the browser to pass the client certificate to the web server for authentication by mutual authentication Secure Sockets Layer (SSL) at the web server level (also known as client authentication). In this situation, you configure PeopleSoft to &quot;trust&quot; the authentication performed by a third-party system at the web server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The function performs the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Extracts the user’s distinguished name (DN) from the client certificate passed to the application server by the HTTP server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Sets a global variable to the DN for a subsequent call to the LDAP_ProfileSynch function.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. Converts the DN to a PeopleSoft user ID and sets the current user context.</td>
</tr>
<tr>
<td>LDAP_Authentication</td>
<td>Required</td>
<td>Applies when you want the user to submit signon credentials at the signon page, and then the system passes the credentials to the directory to perform authentication.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>This function performs the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Searches the directory for all entries that match the entered user name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Attempts to bind to the directory for each found DN using the entered password.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. Sets a global variable to the bound DN for a subsequent call to LDAP_ProfileSynch.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>4. Converts the DN to the appropriate PeopleSoft Username and sets the current user context.</td>
</tr>
<tr>
<td>Function</td>
<td>Exec Auth Fail</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SSO_Authentication</td>
<td>Not Required</td>
<td>Applies in situations where you have single signon configured. The system authenticates the user’s single signon token, which has already been issued by another database (node). This function performs the following: 1. Converts the PeopleSoft User ID to a DN. 2. Sets a global variable for a subsequent call to LDAP_ProfileSynch.</td>
</tr>
<tr>
<td>LDAP_ProfileSynch</td>
<td>Not Required</td>
<td>Applies in situations where PeopleSoft user profiles need to be created or updated with data stored in an LDAP directory. The function requires that the global variable &amp;global_DN has been initialized by one of the previous authentication functions. Remember that regardless of how a user is authenticated, each user populates a row in PSOPRDEFN to which applications can refer during transactions (if necessary). The LDAP_ProfileSynch updates that row in PSOPRDEFN (or user profile cache) with the most current information. As delivered, this function performs the following: 1. Retrieves the LDAP entry specified by &amp;global_DN. 2. Either creates or updates the corresponding PeopleSoft user profile. <strong>Note.</strong> One of the XXX_Authentication functions needs to be carried out prior to running LDAP_ProfileSynch. PeopleSoft provides disabled example Signon PeopleCode with this function. If you work with the NDS, Active Planet, or iPlanet directories, you can use this Signon PeopleCode to assign roles dynamically at signon time. See Chapter 7, “Employing Signon PeopleCode and User Exits,” LDAP_ProfileSynch Considerations, page 123.</td>
</tr>
</tbody>
</table>

When using any of the delivered external authentication solutions, the following items apply:

- All functions get the LDAP server configuration from specifications in PeopleTools Security, Directory, Configure Directory.
- All functions support a single database—multiple databases are not required.

This section discusses:

- WWW_Authentication considerations.
- LDAP_Authentication considerations.
- SSO_Authentication considerations.
- LDAP_ProfileSynch considerations.
WWW_Authentication Considerations

If you intend to authenticate your users at the web server level using mutual authentication SSL (also known as client authentication), the users that are authenticated at the web server level must signon to the system using a different website than users of the other authentication methods.

When you configure a PeopleSoft site to enable public access, a public user ID and password in the web profile provide automatic authentication. Keep in mind that this enables public access for the entire site. The web server always passes the specified public user ID and password to the application server. So, if you want some users to be authenticated by PeopleSoft rather than at the web server level, they must sign in through a PeopleSoft site that has public access disabled.

**Important!** The PeopleCode RevalidatePassword and SwitchUser built-in functions don’t work during a user session for which you’re using WWW_Authentication.

In WWW_Authentication, PeopleSoft performs no validation of users and their passwords. The signon PeopleCode simply accepts the web server’s word that the user was properly authenticated. Your PeopleSoft application has no way to revalidate the user’s password in this case, so you shouldn’t call RevalidatePassword or SwitchUser after WWW_Authentication has been used.

You can determine whether WWW_Authentication has been used by examining a global variable. The signon PeopleCode for WWW_Authentication sets the PeopleCode global variable called &authMethod to the value WWW when a successful signon occurs. In PeopleCode where you want to call RevalidatePassword or SwitchUser, first examine &authMethod. If it’s not equal to WWW, you can call those functions.

See Also

LDAP_Authentication Considerations

When using LDAP_Authentication, the default searching behavior can be overridden by entering attribute=%UserId% in the Search Attribute edit box on the In the Directory Setup page. When you insert this syntax, the system constructs the DN of the user by concatenating the search attribute plus the entered user name with the search base.

For example, given the setup depicted in the following example, if the user entered Sschumacher in the User Name edit box of the signon page, the DN would be:

uid=Sschumacher,ou=Inkoop,o=ccb.com

This constructed DN would be used for the bind attempt rather than searching the directory with the search filter of:

uid=Sschumacher

SSO_Authentication Considerations

If you are using SSO_Authentication and LDAP_ProfileSynch to automatically generate profiles, then the value of the LDAP attribute mapped to User ID must be unique throughout the directory.

The PeopleSoft User ID uniquely identifies a person within PeopleSoft, and a DN uniquely identifies a person within the directory. PeopleSoft maps the PeopleSoft User Profile to a directory entry by specifying the directory attribute that holds the value of the PeopleSoft User ID.
You specify the appropriate mapping between the PeopleSoft system and your directory using the User Profile Caching component. On the Mandatory User Properties page, you must equate the PeopleSoft User ID attribute with an LDAP attribute. For example, in many cases the PeopleSoft User ID is mapped to the LDAP attribute of uid.

With a single signon token, the system can provide the Signon PeopleCode with only a user ID value to identify a person. Then the system must search the directory to find the corresponding DN. If multiple entries within the scope of the search have the same value on the User ID attribute, then PeopleSoft is unable to determine which entry corresponds to the user.

**Note.** It is not required to use these functions to enable single-signon within PeopleSoft. The SSO Authentication combined with the LDAP_ProfileSynch applies only to situations where you want cache profile data from a directory if the user presents a single-signon token during signon.

### LDAP_ProfileSynch Considerations

If you work with the NDS, Active Directory, or iPlanet directories and would like to assign roles dynamically at signon time, you can use the disabled example Signon PeopleCode that PeopleSoft has provided with this function. Directory-specific information is included in the comments of the code.

**Note.** This Signon PeopleCode provides a basic framework for dynamically assigning roles at signon time. If you want to dynamically assign roles at signon time, you must modify this code to work specifically with your NDS, Active Directory, or iPlanet directory schema. You should attempt this only if you are familiar with your directory schema and with writing PeopleCode.

### Using Signon PeopleCode

This section provides overviews of signon PeopleCode and signon PeopleCode permissions, and discusses how to:

- Modify signon PeopleCode.
- Enable signon PeopleCode.
- Access X.509 certificates.

### Understanding Signon PeopleCode

Signon PeopleCode runs whenever a user signs onto PeopleSoft. The main purpose of Signon PeopleCode is to copy user profile data from a directory server to the local database whenever a user signs on. This ensures that the local database has a current copy of the user profile. Because Signon PeopleCode runs at each signon, you are not required to maintain the local copy of the user information.

Signon PeopleCode is not limited to Lightweight Directory Access Protocol (LDAP) integration. You can also use Signon PeopleCode and business interlinks to synchronize a local copy of the user profile with any data source when a user signs on. Because the signon program is written in PeopleCode, you can customize it any way that suits your site requirements.

The basic process flow of Signon PeopleCode is as follows:

- A user enters user ID and password on the signon page.
- PeopleTools attempts to authenticate a user with the local PeopleSoft password.
- Signon PeopleCode runs.
It verifies the user and password, and then updates the local cache of user profiles stored in the PeopleSoft database.

Signon PeopleCode runs only when a user is logging through Pure Internet Architecture, the portal, or a three-tier Windows workstation.

**Note.** If you are using LDAP authentication, the PeopleSoft authentication process will fail because the user password is not stored within the PeopleSoft database. Because of this, if you are using LDAP authentication, you set your Signon PeopleCode program to run when PeopleSoft authentication fails.

---

### Understanding Signon PeopleCode Permissions

Signon PeopleCode scripts run with full permissions of the user they’re invoked as. This includes access to the database using Structured Query Language (SQL), access to the file system, business interlinks, component interfaces application messaging, and so on. A developer could conceivably write a signon PeopleCode program that exposed or corrupted sensitive information. To minimize this risk, you should follow these guidelines:

- You should limit access to the Signon PeopleCode setup page to trusted administrators only.
  
  This will prevent people from configuring un-trusted PeopleCode programs to run at signon time.
- If you aren’t implementing external authentication at your site (all your users are authenticated based on an existing user ID and password with the PeopleSoft database), you should not have the “Exec Auth Fail” column selected for any Signon PeopleCode scripts.
- After a trusted administrator configures the list of functions that should run at signon time, you should use Object Security to restrict access to the record objects that contain the programs.
  
  Only trusted developers should be allowed to modify the PeopleCode on these records.
- Even for trusted developers, it is a good idea to have a second person review the code before testing and moving to production.
- No developer or administrator should have access to the Signon PeopleCode setup page, or the records that contain the signon PeopleCode functions in a production system.

**Note.** The password that the user types on the signon page is never visible to the signon PeopleCode developer. It is impossible to write a script that captures a password entered by a user, and store it in a file or database table.

### Page Used to Develop Signon PeopleCode

<th>Usage</th>
</tr>
</thead>
</table>

### Modifying Signon PeopleCode

Signon PeopleCode is Record PeopleCode, and you view and edit the PeopleCode on the record with which the program is associated. PeopleSoft delivers a PeopleCode program for directory authentication. It is intended for production use but it can also be used as a sample that shows many of the technologies you can include within a Signon PeopleCode program. You can find the delivered PeopleCode program on the following record: FUNCLIB_LDAP.LDAPAUTH (FieldDefault). You can customize it as needed for testing or production use.
Open the record in PeopleSoft Application Designer, and view the PeopleCode with the PeopleCode Editor. The delivered PeopleCode accommodates as many different directory scenarios as possible; it demonstrates use of the business interlink and component interface technologies. You may want to modify the authentication PeopleCode to improve login performance or to accommodate any special directory authentication needs. The delivered program that ships with PeopleTools has the following general flow:

- Searches the directory server for the user profile of the user signing in.
- Using the password the user entered at the signon page, the program attempts to bind (or connect) to the directory server.

If the connect succeeds, then the password is valid.

- Retrieves the user profile of the user signing in.

The program gets the profile from the directory server and creates a local cache copy within the PeopleSoft database. This improves performance by enabling the PeopleSoft applications to access the user profile locally, rather than making a call to the LDAP server every time they need user profile data. If a locally cached copy already exists for the user signing in, the local cache is updated according to the current user in the directory server.

**Note.** To see what the Signon PeopleCode program performs, use the PeopleCode debugger. This enables you to step through the program step-by-step.

The following table presents the key PeopleCode constructs that you use with Signon PeopleCode. Click the function to view more details in the PeopleCode documentation:

<table>
<thead>
<tr>
<th>PeopleCode Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>See Enterprise PeopleTools 8.49 PeopleBook: PeopleCode Language Reference, “System Variables,” %SignonUserPswd.</td>
<td>User password value the user entered at the Signon page. This value is encrypted. This applies to Pure Internet Architecture and Windows signon.</td>
</tr>
<tr>
<td>See Enterprise PeopleTools 8.49 PeopleBook: PeopleCode Language Reference, “System Variables,” %Request.</td>
<td>The HTML request that comes from the browser. In the case of security, this includes any information submitted at the Signon page, such as user ID, password, and any additional fields if you have extended the Signon page. This applies only to Pure Internet Architecture.</td>
</tr>
</tbody>
</table>
Note. Do not use %SwitchUser in Signon PeopleCode.

### Enabling Signon PeopleCode

Access the Signon PeopleCode page.

**Signon PeopleCode page**

Signon PeopleCode is different from other PeopleCode in that you specify which Signon PeopleCode you want to have on a specific Signon PeopleCode page. Notice that the PeopleSoft Password Controls program, which is written in PeopleCode, is also on this page.

By default, some of the Signon PeopleCode programs are disabled. You enable them on this page. You can also enable them by enabling password controls on the Password Controls page or by enabling directory authentication on the Directory Authentication component. After enabling each option on the appropriate page, the system enables the associated PeopleCode program on the Signon PeopleCode page.

**Note.** Using PeopleSoft password controls is valid only if you are not using LDAP authentication. When you’re using LDAP authentication, the directory server, not PeopleSoft, controls the password.

You can add your own PeopleCode programs, but you must add them to another record, and then add them to this page. You add and remove rows from the grid using the plus and minus buttons.

#### Invoke as user signing in

When a PeopleCode program runs, it has to have a context of a user. This is how you indicate to the system which user is executing the program. This is important because the user ID provided must have access to all of the objects that your signon program uses. For example, if you are using LDAP, notice that the Signon PeopleCode contains a business interlink and a component interface. If the user ID provided does not have the appropriate authority to business interlinks or component interfaces, the program fails. Whether you use the value of the user signing in or you create a default user ID for all signon attempts depends on your implementation. For example, if your signon PeopleCode creates local copies of users, you have to configure that program to be “Invoked as” an existing user in the system. In this case, you should create a new user within PeopleSoft that only has authority to access the objects required within your PeopleCode program. You should then enter this user as the “Invoke As” user.

#### Sequence

Displays the sequence in which the signon programs run. You can change the sequence by changing the numerical value in the edit box. The application server runs all programs in the ascending order in which they appear.
Chapter 7 Employing Signon PeopleCode and User Exits

**Enabled**
To enable a program to run at signon, select this check box. If it is not selected, then the system ignores the program at signon.

**Record**
Specify the record on which your record PeopleCode exists.

**Field Name**
Add the specific field that contains the PeopleCode.

**Event**
Add the event that triggers a particular program.

**Function Name**
Add the name of the function to be called.

**Exec Auth Fail (execute if authentication fails)**
Select this check box to "execute if PeopleSoft authentication fails." In other words, if PeopleSoft does not successfully authenticate the user based on the password within the PeopleSoft database, you still want the program to run. For example, you want the LDAP authentication program to run after PeopleSoft denies access so that your program can authenticate the user instead. Also, you can leave this option clear to further secure your system. If you aren’t using LDAP authentication, leaving this option unchecked prevents any program or script from running if your PeopleSoft authorization fails.

### Accessing X.509 Certificates

X.509 certificates are used to authenticate a user at the web server level—SSL with client-side authentication. You can use PeopleCode to access X.509 certificates.

When you use certificate authentication with PeopleSoft, users do not see the PeopleSoft signon page and enter a user ID. Because of this, the X.509 certificate needs to be available in the Signon PeopleCode so you can write PeopleCode that maps the certificate to a PeopleSoft user ID.

The following sample PeopleCode shows how you access X.509 certificates in Signon PeopleCode:

```
Local string &clientDN;
&clientDN = %Request.GetParameter("com.peoplesoft.tools.ssl_client_dn");
```

The value of &clientDN might be similar to the following:

```
E=tom_sawyer@peoplesoft.com, C=US, S=California, L=Pleasanton, ⇒
O=PeopleSoft, OU=PeopleTools, CN=Tom Sawyer
```

### Using the Web Server Security Exit

This section provides an overview of the web server security exit and discusses how to:

- Create a default user.
- Modify the web profile.
- Write a signon PeopleCode program.
- Sign in through the web server.

### Understanding the Web Server Security Exit

Part of the integration technology PeopleSoft delivers is to ensure that our security or authentication system is open and flexible. Because the PeopleSoft applications are now designed for internet deployment, many sites must take advantage of the authentication services that exist at the web server level.
Note. The exits described here are offered in addition to the Signon PeopleCode running on the application server, which itself provides integration. There are no PeopleSoft user ("psuser") exits on the application server; Signon PeopleCode replaces that functionality. On the client side, the functionality is the same as previous releases. You should use Signon PeopleCode when developing new signon integration. The topics in this section support previous implementations.

This section describes a procedure that enables you to configure your implementation so that PeopleTools authentication logic "trusts" the authentication performed at the web server level. The following list presents examples of some of the third-party authentication technologies with which you may want to integrate:

- Web single-signon or authorization or authentication solutions.
- Client-side SSL authentication provided by web servers.
- Public Key Infrastructures, either stand-alone or embedded as part of the network operating system environment.

Note. The previous list is not a list of certified integration points, just examples of authentication technologies that exist in the industry.

For the web server exit configuration to work successfully, the following assumptions should be true:

- You want to authenticate the user at the web server level only, not within the PeopleSoft Application Server. (The configuration discussed in this section enables you to authenticate users within the web server instead of the default configuration, where the application server controls the authentication logic.)
- Your web server environment includes a mechanism to identify and authenticate a user. This may be through a signon page with a user ID and password, through a digital certificate, or through one of several industry-standard authentication methods.
- Your web server has the capability of passing the user ID to the application server through the HTTP request PeopleCode object. For this you can use an HTTP header variable, a cookie, or a form field.

Note. Configuring the following authentication system is not a delivered feature. It requires development outside of the realm of PeopleSoft, and because of that, you should have the appropriate level of internet development expertise to make sure that you are passing the appropriate information to the PeopleSoft system.

Creating a Default User

Create a default user ID using PeopleTools Security.

This user ID does not require any roles or permission lists. You should consider creating a long password that is difficult to guess.

For this example, we create the following user profile and password:

- User ID: default_user
- Password: ekdJ3838**&^%kdjflslsdkjHJJK

Modifying the Web Profile

After you create the default user, you can modify the web profile to include the default user signon information.
To modify the web profile to include the default user signon information, you first must enable public access to the portal. In the Public Users section of the Web Profile Configuration - Security page, select Allow Public Access to indicate that the system should not prompt users to sign on when they click a direct link to a page. When this is selected, the PeopleSoft system does not display the password page to the user. Instead, the system authenticates users with the values specified in the User ID and Password fields in the same section of the page.

Note. In the following discussion, notice that the user is never actually signed on as “default_user.” The user ID you specify is just a temporary value used to initiate a secure connection to the application server. The application server then determines the real user ID using signon PeopleCode. The real user ID is contained in the request object, and all the other user information, such as language code, roles, and so on, is already stored in the PeopleSoft system or an LDAP directory server.

Besides selecting the Allow Public Access check box, you also must set the user ID and password parameters to reflect the user ID created in the previous step. For example, set the User ID field value to `default_user`, and the Password field to `ekdjl3838**&^%^dkjflsdkffjHJIK`. Because you hard-code the signon values in the web profile, no end user ever needs to know them—their use is transparent.

You should limit access to and knowledge of the public access user ID and password values. You can do this by sharing this information only with a small number of trusted security administrators. Also, you should make sure that only these select few have read access to the web profile.

Even if somebody does discover the public access user ID and password values, he or she won’t be able to sign on to the PeopleSoft system. Recall that the default_user doesn’t have any roles or permission lists. Alternatively, a sophisticated hacker could attack the application server directly by sending it a connection request formatted in the BEA Tuxedo/Jolt protocol and potentially assume the identity of a user. You should use network and firewall products to restrict the origin of requests sent to the application server.

Note. To prevent a user ID from being the default user on the signon page, set the Days to Autofill User ID property on the Web Profile Configuration - Security page to 0.

See Also

**Writing a Signon PeopleCode Program**

In addition to creating a default user and enabling public access, you also must write a Signon PeopleCode program that:

- Uses data within the HTTP request to determine the real user ID.

  Your web server authentication system should be configured to insert the USERID of an authenticated user into the HTTP request as a header, a form field, or cookie.

- Creates or updates the local copy of the user profile within the PeopleSoft database.

The programs developed to perform this task vary depending on where the web server inserted the user ID in the HTTP request and where the user profiles are stored. For example, some systems use an HTTP header to store the user ID, while others use cookies or form fields.
If the web server security product uses LDAP as a backend data store for user profiles, you can reuse some of
the LDAP authentication PeopleCode to copy the profile from LDAP to the local database. The user profile
may also be stored in another database, or a Windows NT domain registry. In either case, you must write
PeopleCode to retrieve the value and make a local copy.

**Note.** You can’t use the LDAP Authentication PeopleCode program as delivered. This program performs
LDAP authentication and copies the user profile from an LDAP directory to the local database. You can,
however, use the code that copies the profile from the directory, as a template for the code you need in this case.

The following is sample PeopleCode with the External_Authentication function. It is a simple example of
retrieving the user ID from a form field named UserID:

```pcode
/*\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\n```

After you have written the program, you must set the Signon PeopleCode program to run only if authentication
is successful. On the Signon PeopleCode page, you set the running as follows:

- The Exec Auth Fail check box must not be selected.

  You want this PeopleCode to run only if the connection to the application server originates from a web server
  that presents a valid user ID and password. In this case, the user ID is default_user and the associated
  password. You should only select the Exec Auth Fail check box when the PeopleCode itself authenticates the
  user, not when the program relies on the web server to perform authentication.

- You must set Invoke as to a user profile that has the appropriate roles and permissions to do all the operations
  in the External_Authentication function.

  For example, if External_Authentication creates a local copy of the user profile using the User Profile
  component interface, signon_peoplecode_user must have permission to use this component interface. The
  Signon PeopleCode program runs under the signon_peoplecode_user user ID.

**Note.** Before running the PeopleCode, the application server authenticates the User ID and Password field
values in the Public Users section of the Web Profile Configuration - Security page.

**Signing In Through the Web Server**

This section provides a step-by-step example of the steps that occur within the system after you have it
configured to trust authentication performed at the web server level:
### Chapter 7 Employing Signon PeopleCode and User Exits

<table>
<thead>
<tr>
<th>Step</th>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Browser</td>
<td>The user clicks a link to the PeopleSoft application, for example <a href="http://serverXYZ/servlets/psportal/peoplesoft8/?cmd=start">http://serverXYZ/servlets/psportal/peoplesoft8/?cmd=start</a>.</td>
</tr>
<tr>
<td>2</td>
<td>Web server</td>
<td>The web server receives the request for the uniform resource locator, authenticates the user, and adds the user ID to the HTTP request for the resource. The method the system uses to authenticate the user and the method the web server uses to add the user ID to the HTTP request depends on your implementation. For example, it could be a third-party web single signon or authorization solution, a PKI/ digital certificate, or SSL with client-side authentication.</td>
</tr>
<tr>
<td>3</td>
<td>Servlet</td>
<td>The PeopleSoft servlet receives the HTTP request, which includes the user ID in a header, cookie, or form field, and connects to the application server using the public user ID and password from the web profile.</td>
</tr>
</tbody>
</table>
| 4    | Application server | The application server authenticates the connection from the web server by checking the public access user ID and password against the values stored in PSOPRDEFN. The user ID and password must be valid for the connection to succeed and for Signon PeopleCode to run.  
**Note.** The password verification prevents a sophisticated hacker from connecting to the application server directly and carrying out service requests. |
| 5    | Signon PeopleCode | Signon PeopleCode runs, under the context of the signon_peoplecode_user, with all the permissions of this user. It grabs the "real" user ID from the HTTP request and creates a copy of the user profile in the local database (if appropriate). It also calls the PeopleCode built-in SetAuthenticationResult and passes the user ID, and an AuthResult of "true." The PeopleCode program always passes "true" for AuthResult because the application server is "trusting" the authentication logic of the web server.  
The Pure Internet Architecture session is set to the user ID of whatever you pass into SetAuthenticationResult. For example:  
```javascript
SetAuthenticationResult(True, "TSAWYER", ",", False);
```
In this case, the system sets the session to TSAWYER. The user can access all the pages to which TSAWYER has access. |
Using the Windows Security Exit

This section provides an overview of Windows security exits and discusses how to:

• Customize PSUSER.DLL.
• Implement a customized PSUSER.DLL.

Understanding Windows Security Exits

Almost all end users will access PeopleSoft using a browser, so you may not need to implement any client-side Windows exits. However, you can provide this functionality, perhaps for developers.

The Windows client-side exits are:

• PsGetTuxConnectInfo(): Used only for three-tier Microsoft Windows workstations running PeopleSoft Application Designer or Query, for example.
• PsGetLogonInfo(): Used for Microsoft Windows workstations in both a two-tier and three-tier environment.

Use these functions to create a customized PSUSER.DLL. These exits are used primarily for the PeopleTools Development Environment, PeopleSoft Query users, or PeopleSoft Tree Manager users. Unless you intend to deploy PeopleSoft applications to Microsoft Windows workstations, these exits are seldom used.

PsGetLogonInfo was used for the Microsoft Windows Client in previous releases to fill in the signon screen programmatically without displaying it to the user.

With the three-tier Microsoft Windows Client signon you can also bypass the PeopleSoft Signon window by modifying the PsGetLogonInfo() function as with the two-tier connection. But because you are connecting to the database through Tuxedo, there are some other authorizations that need to occur. This diagram shows those authorizations:
The required authorizations are as follows:

1. The PsGetLogonInfo function must specify APPSERV as the szDBType parameter to bypass the PeopleSoft Signon window.
2. To connect to the Tuxedo application server, the PsGetTuxConnectInfo function retrieves authentication information from directory server.
3. If the authentication information is valid, Tuxedo allows connection.
4. Tuxedo must connect to the database server.
   The application server verifies the authentication information passed by the PsGetTuxConnectInfo function.
5. If the authentication is successful, the user is connected to PeopleTools.

The following diagram illustrates the results produced by customizing the PSUSER.DLL PsGetLogonInfo function to bypass the PeopleSoft Signon dialog box:
In this case, the sequence of events is as follows:

1. From the workstation the user runs PSTOOLS.EXE. PSTOOLS.EXE calls the PSUSER.DLL.
2. The PsGetLogonInfo function supplies user signon information.
   
   If information is validated by the RDBMS, the user is connected as User ID or Connect ID, and then after the security profile is retrieved and validated the user is connected as Access ID.
3. If the signon information is valid, the PeopleSoft system connects the user to the specified PeopleTool.

**Customizing PSUSER.DLL**

If your site has implemented a security system external to the PeopleSoft system, you can use that external system to validate your Microsoft Windows Client PeopleSoft users, also. This is done through the user exit (PSUSER.DLL), which also enables you to specify your own encryption for use in encrypting passwords.

To enable these options, you must modify several procedures in the PSUSER.C, and recompile to create a new PSUSER.DLL. Then you must install the new DLL file wherever users run the PeopleSoft executables, such as PS_HOME on the file server.

In this section, we discuss the security functions that we provide and how you can tailor them for use in your own system. To successfully complete any customizations with these functions, you must be familiar with the C programming language.

**PsGetLogonInfo**

The PsGetLogonInfo function is always called when the PeopleSoft system is started. If you’re already controlling which users can access the PeopleSoft applications—through a custom security solution—you may want to use this function to let those users start the PeopleSoft system directly without being prompted for PeopleSoft signon information. This function can also be overridden to provide information to the three-tier exit, PSGetTuxConnectInfo.

As delivered, PsGetLogonInfo returns a FALSE value and is ignored. However, if it returns a TRUE value, the PeopleSoft signon dialog box is bypassed and the information that you’ve coded into the function is used as the signon parameters.

You’ll find this function in your PS_HOME\src\PSUSER\PSUSER.C file. The code initially looks like this:
To activate the automated signon feature, you must comment out the “false” return and uncomment the “true” return line. The return value is historical and ignored. The user exit bypasses the screen only if it receives enough information.

Then you must code the appropriate logic to fill in the values for the parameters to the PSGetLogonInfo routine. If you provide all of the appropriate field values, the system proceeds directly to your default initial window specified in the PeopleSoft Configuration Manager Startup tab. Your procedure might look something like this:

```c
/* Function: PsGetLogonInfo */
*
* Description: Sample routine to get logon information.
* *
* Returns: TRUE if logon information returned
* FALSE to ignore
*
*******************************************************************************/

PS_EXPORT(BOOL) PsGetLogonInfo(LPPSLOGINFO lpPsLogInfo)
{
    // ask for user input only when it is the first signon
    if (!lpPsLogInfo->bSubsequentSignon)
    {
        // test auto logon
        strcpy(lpPsLogInfo->szDBChange, "NO");
        strcpy(lpPsLogInfo->szDBType, "DB2");
        strcpy(lpPsLogInfo->szDBName, "C9442A");
        strcpy(lpPsLogInfo->szServerLogonSec, "NO");
        strcpy(lpPsLogInfo->szOprId, "C944201");
        strcpy(lpPsLogInfo->szOprPswd, "C944201");
        return(TRUE);
    }
    ------------------ END SAMPLE CODE ------------------

    return(FALSE);
}
```
//return(FALSE);
}

**Note.** If any required signon parameters are omitted, the signon screen appears and the missing values are set by default to the settings found in the registry. One way to control whether the signon dialog displays is to have PSUSER.DLL provide (or not provide) the user’s password.

All parameters except `bSubsequentSignon`, which is Boolean, are of the data type CHAR and are defined as follows:

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description and Values</th>
</tr>
</thead>
</table>
| BSubsequentSignon | An initial or subsequent signon. Values are:  
| | FALSE: Initial signon. User just started the PeopleSoft system.  
| | TRUE: Subsequent signon. User probably selected an item from the Go menu in the Development Environment (PSIDE.EXE). |
| szDBChange | Change database name or type. Values are:  
| | TYPE: Allow to change type and name.  
| | YES: Allow to change name only.  
| | NO: Do not allow change to either. |
| szDBType | Database type. Values are:  
| | DB2: DB2 z/OS through Centura Gateway.  
| | DB2ODBC: DB2 z/OS through ODBC.  
| | DB2UNIX: DB2 UNIX.  
| | INFORMIX: Informix.  
| | MICROFT: Microsoft SQL Server.  
| | ORACLE: Oracle Server.  
| | SYBASE: Sybase SQL Server.  
| | APPSERV: Application Server. |
| szDBName | Database name or application server name. |
| szServerLogonSec | The Change Password feature. Values are:  
| | YES: enabled.  
<p>| | NO: disabled. |</p>
<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description and Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>szOprId</td>
<td>User ID.</td>
</tr>
<tr>
<td>szOprPswd</td>
<td>User password.</td>
</tr>
</tbody>
</table>

**PsGetTuxConnectInfo**

When operating in three-tier mode, `PsGetTuxConnectInfo` is called after `PsGetLogonInfo` and just before connecting to Tuxedo. Use this function to pass authentication data (key) to the server. Use this to either supplement or replace PeopleSoft’s standard authentication process.

You’ll find this function in your `PS_HOME/src/PSUSER/PSUSER.C` file. The delivered code looks like this:

```c
PS_EXPORT(BOOL) PsGetTuxConnectInfo(NETEXTAUTH *pExtAuth) {
  /*------------------------ BEGIN SAMPLE CODE ---------------------------
  // set the auth information size and allocate space for auth information
  pExtAuth->nLen = 25;
  pExtAuth->pData = (unsigned char *) malloc(pExtAuth->nLen);
  // set your authentication string
  memcpy(pExtAuth->pData, "NATHAN HORNE\0\0PEOPLESOFT\0", pExtAuth->nLen);
  return(TRUE);
  --------------------------- END SAMPLE CODE --------------------------*/
  return(FALSE);
}
```

Implementing a Customized PSUSER.DLL

To rebuild and implement PSUSER.DLL:

1. Compile PSUSER.C and create PSUSER.DLL.
   
   To do this for Windows platforms, run NMAKE while in the `PS_HOME\src\PSUSER\WINX86` directory. You must use a Microsoft Visual C++ 6.x compiler.

   On UNIX, run the shell script `psuser.sh` in `pshome\src\psuser`.

   The resulting file, PSUSER.DLL, is used by PeopleTools (PSTOOLS.EXE), and the Windows COBOL interfaces. For Windows NT, you must copy this file into your COBOL directory.

2. Distribute PSUSER.DLL to workstations.

   If your workstations run the PeopleSoft executables from a common file server, you must ensure that your new PSUSER.DLL is copied to that file server. If any of your workstations run the PeopleSoft executables locally, PSUSER.DLL must be distributed to such workstations.
CHAPTER 8

Implementing Single Signon

This chapter provides an overview of single signon and discusses how to:

• Implement PeopleSoft-only single signon.
• Implement single signon between Oracle and PeopleSoft applications.

Understanding Single Signon

This section discusses:

• Single Signon Options.
• PS_TOKEN.

Understanding Single Signon Options

Single signon refers to the ability of users to navigate freely within a system of multiple applications after only being authenticated once. There are three different ways to configure single signon, depending on the participating applications that you have installed, and the middleware platforms on which they run. The following table displays the single signon options.

<table>
<thead>
<tr>
<th>Single Signon Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeopleSoft-only</td>
<td>This option enables single signon only between multiple PeopleSoft applications, such as PeopleSoft Human Capital Management and PeopleSoft Customer Relationship Management. After a user is authenticated by one PeopleSoft application, an in-memory value gets set in the browser (PS_TOKEN cookie) that the next PeopleSoft application uses for a user credential. If you only have PeopleSoft applications, use this option. <strong>Note.</strong> This option is the same single signon feature offered in previous PeopleSoft releases. See Implementing Single Signon Between PeopleSoft Applications.</td>
</tr>
<tr>
<td>Single Signon Option</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Oracle as a Trusted Node</strong></td>
<td>If you have Oracle applications and PeopleSoft applications being used in your organization, users, who have been authenticated by the Oracle system, can freely access PeopleSoft applications without having to be re-authenticated. This option is tailored for sites running their PeopleSoft applications on BEA WebLogic or IBM WebSphere. This option applies to all previous PeopleTools 8.x versions. For example, if you intend to incorporate applications running on Enterprise PeopleTools 8.46, you can implement this option. See Implementing Oracle as a Trusted Node</td>
</tr>
<tr>
<td><strong>Oracle as a Partner Application</strong></td>
<td>If you are running your PeopleSoft applications on Oracle Application Server 10g this is the recommend option. This option is not available if you are using BEA WebLogic or IBM WebSphere as your web server. This option has the Oracle Single Signon server performing authentication for both Oracle applications and PeopleSoft applications. That is, end users signing in through a PeopleSoft application get authenticated by the Oracle Single Signon server the same as users signing in through an Oracle application. This option requires you to: • Use Oracle Application Server 10g as your web server. • Have at least PeopleTools 8.47 installed. See Implementing Oracle as a Partner Application</td>
</tr>
</tbody>
</table>

**Note.** You must ensure that before users attempt to use the single signon functionality, a valid user profile is defined for each user in each participating application database. You can accomplish this in a variety of ways, such as automatically generating user profiles based on users’ LDAP information, replicating user profiles through Integration Broker at initial signon, or manually defining user profiles for the authorized users before going live.

**Understanding the PS_TOKEN Cookie**

When the system authenticates a user, it distributes the PS_TOKEN cookie to the browser. The PS_TOKEN cookie holds user authentication information in the browser that a PeopleSoft system uses to verify user access. Having the token in the browser memory allows the user to navigate freely within the system without having to provide user credentials repeatedly.

The key security features of the PS_TOKEN cookie authentication are:

• The cookie exists in memory; it is not written to disk.
• There is no password stored in the cookie.
• You can set the expiration of the cookie to be a matter of minutes or hours; so if a cookie is intercepted it will only be usable for the duration you specify.
Chapter 8  Implementing Single Signon

The following table presents the fields that appear in the PeopleSoft authentication token:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UserID</td>
<td>The user ID of the user to which the server issued the token. When the browser submits this token for single signon, this is the user that the application server logs on to the system.</td>
</tr>
<tr>
<td>Language Code</td>
<td>Specifies the language code of the user. When the system uses his token for single signon, it sets the language code for the session based on this value.</td>
</tr>
<tr>
<td>Date and Time Issued</td>
<td>Specifies the date and time the token was first issued. The system uses this field to enforce a time out interval for the single signon token. Any application server that accepts tokens for signon has a timeout minutes parameter configured at the system level. A system administrator sets this parameter using the PeopleTools Security, Single Signon page. The value is in Greenwich Mean Time (GMT) so it does not matter which time zone the application server is in.</td>
</tr>
</tbody>
</table>
| Issuing System       | Shows the name of the system that issued the token. When it creates the token, the application server retrieves this value from the database. Specifically, it retrieves the defined Local Node. You configure a node only to trust single signon tokens from specific nodes. Consequently, an application server needs the name of the issuing system so that it can check against its list of trusted nodes to see if it trusts the issued token.  

**Note.** Single signon is not related to Integration Broker, except for the fact that single signon functionality leverages the use of nodes and local nodes. |
| Signature            | This field contains a digital signature that enables the application server using a token for single signon to ensure that the token hasn’t been tampered with since it was originally issued. The system issuing the token generates the signature by concatenating the contents of the token (all the fields that appear in this table) with the node definition password for the local node. Then the system hashes the resulting string using the SHA1 hash algorithm. For example (“+” indicates concatenation),

\[
signature = \text{SHA1} \text{Hash} ( UserID + Lang + Date Time Issued + Issuing System + Local Node Pswd )
\]

There is only one way to derive the 160 bits of data that make up the signature, and this is by hashing exactly the same User ID, Language, Date Time, Issuing System, and node password.

**Note.** If you are using digital certificate authentication, the signature of the digital certificate occupies this space. The above description applies to using password authentication only. |

**Note.** Single signon does not depend on Lightweight Directory Access Protocol (LDAP) directory authentication. You can implement single signon and not LDAP, you can implement LDAP and not single signon, or you can implement both LDAP and single signon.
Implementing PeopleSoft-Only Single Signon

This section provides an overview of PeopleSoft-only single signon and discusses:

- Working with the Single Signon page.
- Defining nodes for single signon.
- Sample single signon transaction.
- Single signon configuration considerations.
- Single signon configuration examples.
- Making the PeopleSoft single signon token secure.
- Using the single signon API.
- Configuring single signoff.

Note. In this configuration, you must create PeopleSoft node definitions for each of the participating applications. You can run any of the participating applications on Oracle Application Server 10g, BEA WebLogic, or IBM WebSphere. You can use passwords or digital certificates for single signon authentication.

Understanding PeopleSoft-Only Single Signon

PeopleSoft software supports single signon within PeopleSoft applications. Within the context of your PeopleSoft system, single signon means that after a user has been authenticated by one PeopleSoft application server, that user can access a second PeopleSoft application server without entering an ID or a password. Although the user is actually accessing different applications and databases, the user navigates seamlessly through the system. Recall that each suite of PeopleSoft applications, such as HR or CRM, resides in its own database.

Note. The PeopleSoft-only single signon solution applies only to PeopleSoft applications.

After the first application server/node authenticates a user, the system delivers a web browser cookie containing an authentication token (PS_TOKEN). PeopleSoft uses web browser cookies to store a unique access token for each user after they are authenticated initially. When the user connects to another PeopleSoft application server/node, the second application server uses the token in the browser cookie to re-authenticate users automatically so they don’t have to complete the signon process repeatedly.

Single signon is critical for PeopleSoft portal implementations because the portal integrates content from various data sources and application servers and presents them in a unified interface. When the users sign on through the portal, they always take advantage of single signon. Users need to signon once and be able to navigate freely without encountering numerous signon screens. Because single signon is so integral to the portal, you always need to configure it before deploying a live portal solution.

Note. The browser cookie is an in-memory cookie and is never written to disk. The cookie is also encrypted to prevent snooping and digitally signed to prevent tampering.

Working with the Single Signon Page

Select PeopleTools, Security, Security Objects, Single Signon to access the Single Signon page.
Chapter 8 Implementing Single Signon

**Single Signon**

**Authentication Token expiration time**

Expiration Time in minutes: 720  
Valid values are 1 - 10,000

**Trust Authentication Tokens issued by these Nodes**

<table>
<thead>
<tr>
<th>Message Node Name</th>
<th>Description</th>
<th>Local Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>QE_LOCAL</td>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>

Message Node name

Shows the name of the Message Node. In order to share authentication tokens between nodes, the nodes need to trust each other. By adding a node to this grid, you indicate that a particular node is known to the system and trusted. When a node is trusted, the local node accepts tokens issued by it.

By default, no nodes appear in the trusted nodes list. If you want to implement single signon, you need to explicitly configure your system to support it by adding trusted nodes.

First, you need to add the local node to the grid as a node must be able to trust its own tokens. When you sign on to the portal, the system authenticates users with a single signon token issued by the local system. The portal won’t be able to sign on unless the local node is trusted. Then you add the names of other nodes in the system that should be trusted.

**Note.** You define nodes in Portal, Node Definitions.

Local Node

Indicates whether the node is local or not.

**Expiration time in minutes**

You need to set an expiration time for tokens this system accepts for authentication. Otherwise, once the user is authenticated, the user could be authenticated and signed on to the system with the token for as long as it stays up and running. You can set the authentication interval to be minutes, hours, or days depending on your signon strategy.

The value is in minutes. For example, 480 minutes is 8 hours. This is global setting for all users of your PeopleSoft system that get issued the cookie. A short expiration period is more secure, but less convenient because users need to enter their passwords more frequently.

The system accepting the token controls the expiration time, not the issuing system. For example, Node HCM_WEST, which has an expiration time of 100 minutes, issues a token to a user. The user attempts to use that token to sign on to Node FIN_EAST, which has an expiration time set to 60 minutes. If a period greater than 60 minutes has transpired, Node FIN_EAST rejects the token. When a node rejects a single signon token, the system prompts the user to enter a user ID and password on the standard signon screen.

**Note.** This expiration time is separate from the timeouts you specify in the Permission Lists and the web server configuration files.

Copyright © 1988-2007, Oracle. All rights reserved.
Note. After you update the list of trusted nodes, the system automatically recognizes the new list. Rebooting the application server is not required.

Defining Nodes for Single Signon

Select PeopleTools, Portal, Node Definitions to access the Node Definitions page.

The two options related to single signon are:

**Authentication Option**

Determines how nodes in a single signon configuration authenticate other nodes in the same configuration. You have the following options:

- *None*. Specifies no authentication between nodes.

  **Note.** This option conflicts with PeopleSoft Integration Broker. If you select None, PeopleSoft Integration Broker messaging will fail, as will Single Signon.

- *Password*. Indicates that each node in the single signon configuration authenticates other nodes by way of knowing the password for each node. For example, if there are three nodes (A, B, and C), the password for node A needs to be specified in its node definition on nodes A, B, and C.

- *Certificate*. Indicates that a digital certificate authenticates each node in the single signon configuration. You should use certificate authentication for single signon. For certificate authentication, you need to have the following in the key store in the database for each node:
  - Certificate for each node.
  - Root certificate for the CA that issued the certificate.

  **Important!** For single signon, the alias for the certificate of a node needs to be the same as the node name. Also, you must set up your digital certificates before you set the authentication option to certificate authentication.

**Default Local Node**

The default local node is used specifically for setting up single signon. This indicates that the current node represents the database you’re signed on to. The options you set for single signon should be made on the default local node.

Setting up Certificate Authentication

This section provides additional details and steps to assist the configuration of certificate authentication used in a single signon implementation.

The assumption in the following sections is that single signon is being set up between two PeopleSoft systems. The master PeopleSoft Portal has Default Local Node defined as QE_LOCAL and remote node as PTNTAS05. The slave PeopleSoft Content Portal has a Default Local Node defined as PTNTAS05 and remote node as QE_LOCAL.
Step 1: Define QE_LOCAL Portal System (master) to use Certificate as Authentication option

To Define QE_LOCAL Portal System (master) to use Certificate as Authentication option:

1. Log on to the portal master.
3. Click the QE_LOCAL default local Node.
4. For Authentication Option, choose Certificate from the drop-down list.
5. Make sure PTNTAS05 is defined as Remote Node.

Step 2: Define the Content-side (slave) to recognize Portal to establish the trust

To Define the Content-side (slave) to recognize Portal to establish the trust:

1. Log on to the Content-side Portal (slave).
2. Select PeopleTools, Portal, Node Definition.
3. Make sure that the QE_LOCAL node is defined as remote Node, and click the QE_LOCAL remote Node.
4. For Authentication Option, choose Certificate from the drop-down list.
5. Select PeopleTools, Security, Security Objects, Single Signon and confirm that the QE_LOCAL message node appears in list of trusted nodes in the Trust Authentication Tokens issued by these Nodes group box.

Step 3: Create Private Key and Install Digital Certificate for Local Node

To Create Private Key and Install Digital Certificate for Local Node:

1. Login to the Portal.

   Note. Make sure that Root CA with Issuer Alias = PeopleTools is available.

3. Click the Add a new row button (+).
4. Select Local Node, Type QE_LOCAL, and select Issuer Alias=PeopleTools. Click Request and fill the following form. Use Key Size=512 bits for UNIX Application Server Common Name = QE_LOCAL Click OK.
5. Select all and copy the request.
6. Go to the certificate provider and select Request a certificate.
7. Select “Submit a certificate request by using a base-64-encoded CMC or PKCS #10 file, or submit a renewal request by using a base-64-encoded PKCS #7 file.”
8. Paste the request, and click submit and download.
9. Open the certificate with a text editor, such as c:\temp\newcert.
10. Select All and copy the certificate.
12. Click Import.
13. Paste the certificate into the text box.

Note. Make sure no space after END CERTIFICATE, otherwise, you are not allowed to save. Click the OK button.

---

**Step 4: Install Digital Certificate for Remote Node on Content-Side.**

To Install Digital Certificate for Remote Node on Content-Side:

1. Log onto Content-side (Slave) Portal.
3. Click Add a new row button (+).
4. Select Remote Node, Type QE_LOCAL, and select Issuer Alias = PeopleTool.
5. Click Import.
6. Open c:\temp\newcert with a text editor and copy and paste the digital certificate into the empty text box.
7. Click OK.

---

**Sample Single Signon Transaction**

Now that you have a general understanding of why a single signon implementation is useful, and some of the details involved with PeopleSoft-only single signon, this section presents an example of how the PeopleSoft—only single signon scheme works.

Suppose there are two databases, or nodes: an HCM database and Financials database. Recall that the terms database and node are synonymous. Each database has one application server and one web server. The following steps describe the "under-the-covers" events that occur when a user signs on to the HCM database, completes a transaction, and then click a link that targets a page in the Financials database.

**Step 1: User Signs on to HCM Application**

The following occurs:

- User PTDMO goes to link http://HCM.peoplesoft.com/peoplesoft8/signon.html
- User enters ID and Password at the signon page, clicks login.

**Step 2: Application Server Authenticates User**

The following occurs:

- Web server relays login request to HCM application server.
- Application server authenticates the user.

**Step 3: Application Server Generates Single Signon Token**

The following occurs:

- If the signon attempt to the HCM application server is successful, the application server generates a single signon token.
- Application server encrypts and encodes the token (base 64).
• Application server sends the token to the web server, along with a return code indicating that the system authenticated the user.

**Step 4: Web Server Creates Cookie in User’s Browser**

When the web server receives the single signon token from the application server, it creates a cookie and inserts the cookie in the user’s browser.

If the browser is configured to show the Security Alert dialog, then the user sees a message similar to the following example. In most cases, you don’t configure browsers to show this dialog; this dialog box is just an example of the data that the browser receives.

![Security Alert Dialog](image)

The cookie that the web server distributes for PeopleSoft single signon is named PS_TOKEN. In this case the domain rt-sun23.peoplesoft.com set the cookie.

Notice that the cookie expires at the end of session. This indicates that the system never writes the cookie to disk, the cookie exists in the memory of the browser for the duration of the session.

The web server inserts the single signon token within the Data field of the cookie. So that the system can send the binary data across the HTTP protocol, the token data is encrypted and base 64 encoded.

**Step 5: User Needs to Access Financial Application**

After the user completes a few transactions in the HCM system, suppose they arrive at a page containing a link to the Financial system. The user clicks the link, and because they’ve already signed on (entered their ID and Password) to the HCM system they don’t need to sign on again.

The user’s browser sends the PS_TOKEN cookie to the Financials web server.
Step 6: Financials Web Server Receives PS_TOKEN Cookie

The Financials web server detects that the user hasn’t been authenticated by the Financials system yet, however, because the web server received the signon cookie it does not display the signon page.

To retrieve the page the user requested (by way of the link in the HCM application), the Financials web server attempts to connect to the Financials application server. It passes only the Data field from the PS_TOKEN cookie because the application server needs only the information in the Data portion.

Step 7: Financials Application Server Authenticates PS_TOKEN

The Financials application server performs the following checks against the PS_TOKEN Data field before allowing the user to connect:

- Is this a trusted node?
  The application server checks to see that the message node name listed as the Issuing System is a trusted node. The list of trusted nodes for the Financials system resides in the PSTRUSTNODES table. You configure the list using PeopleTools, Security Objects, Single Signon. The Single Signon page enables the administrator of the Financials system to "trust" authentication tokens generated from HCM as well as any other nodes deemed trusted.

- Has the token expired?
  The application server checks that the authentication token hasn’t expired. Using the Issued Date and Time field within the token, the Financials application server makes sure that the token was issued within the interval between the timeout minutes value and the current time. You configure a token’s expiration time on the Single Signon page.

  Note. It is important to note that the expiration parameter specified in the Financials system is the relevant value, not the expiration value specified in HCM. This enables the Financials administrator to control the maximum age of an acceptable token. It’s also important to consider that all times are in Greenwich Mean Time (GMT), so it doesn’t matter what time zones the systems are in.

- Has the signature been tampered with?
  The application server checks that the signature is valid. The Financials application server takes all the fields in the token and the Node password for the issuing node and generates a hash. The token is valid only if the signature within the token exactly matches the one generated by the Financials application server. Because an exact match is the only acceptable situation, Financials can be sure that HCM generated the token, and that it hasn’t been tampered with since it was generated. If a hacker intercepted the token in transit and changed the User ID, Language, and so on, the signatures wouldn’t match and as a result the Financials application server would reject the token.

  Note. You should use digital certificate authentication when implementing single signon.

PeopleSoft-Only Single Signon Configuration Considerations

The following topics describe some items you might want to consider as you implement your single signon configuration.

Single Authentication Domain Limitation

Web servers must be assigned to the same authentication domain — the server name in the URLs used to access them must contain the same domain name. A browser sends a cookie back only to the same domain from which it received the cookie.
On PeopleSoft systems, an authentication domain is not the same thing as an internet protocol (IP) address. It’s a logical URL address that you specify during Pure Internet Architecture setup, and its purpose is to associate different web servers (even at different physical locations) so that they appear to be at the same location to the PeopleSoft applications that use those web servers.

**Important!** Specifying authentication domains incorrectly for multiple Pure Internet Architecture installations can produce single signon errors.

If you want to keep two PeopleSoft applications from erroneously attempting to employ single signon, make sure that the authentication domain you specify for one application’s web server is not a subset of the authentication domain you specify for the other. For example, if your CRM web server has an authentication domain of `.user.mycompany.com`, your Financials web server authentication domain must not be `.mycompany.com` (the parent of the CRM server domain) or `.fin.user.mycompany.com` (a child of the CRM server domain). It can, however, be `.fin.mycompany.com` (or any child of that domain).

If you **do** want two PeopleSoft applications to employ single signon, you must ensure that each application contains a definition of the other as a trusted node, and you must specify the same authentication domain for both applications’ web servers during Pure Internet Architecture setup.

Furthermore, the web server that generates the cookie must have the domain that shares the PS_TOKEN cookie specified in the web profile of the local Pure Internet Architecture web site. For example, in the context of our HCM to Financials example, the web profile for the HCM web server must contain the value of `.peoplesoft8.com` in the Authentication Domain property.

**Note.** You must specify the leading dot (.).

The single domain issues occur in the following situations:

- You’re using straight Pure Internet Architecture, as in you are deploying applications but not by way of the portal.
- You’re using the portal with frame-based templates. All PeopleSoft portal solutions products (Enterprise, Employee, Customer, Supplier portals) are built using frame-based templates.

Frame-based templates aren’t proxied automatically. Proxying refers to when the system rewrites the URL to point to a location on the portal servlet, rather than the original location of the URL.

**Single Signon Between Machines without DNS Entries**

If you’re setting up single signon between machines that don’t have DNS entries, you need to modify the hosts file on the machine that’s running the web browser. For example, let’s say that you are using machine a.peoplesoft.com to signon to the web server a.peoplesoft.com, and then access b.peoplesoft.com using single signon. In this situation, you would need to update the hosts file on a.peoplesoft.com as follows.

```plaintext
# Copyright (c) 1993-1999 Microsoft Corp.
#
# This is a sample HOSTS file used by Microsoft TCP/IP for Windows.
#
# This file contains the mappings of IP addresses to host names. Each
# entry should be kept on an individual line. The IP address should
# be placed in the first column followed by the corresponding host name.
# The IP address and the host name should be separated by at least one
# space.
#
# Additionally, comments (such as these) may be inserted on individual
```
# lines or following the machine name denoted by a ‘#’ symbol.
#
# For example:
#
# 102.54.94.97  rhino.acme.com  # source server
# 38.25.63.10   x.acme.com    # x client host

127.0.0.1  localhost
216.131.221.88  a.peoplesoft.com
66.122.220.101  b.peoplesoft.com

See Enterprise PeopleTools 8.49 PeopleBook: Internet Technology.

**Domain Names**

You need to use a fully qualified domain name when addressing the web server in your browser. For example, you would need to enter the following:

http://hcm.peoplesoft.com/myapplication/signon.html

as opposed to the following:

http://hcm/myapplication/signon.html

When using the portal, the domain name that you specified in the Portal URI Text edit box on the Content Provider administration pages needs to match the fully qualified domain name you entered for the authentication domain. For example, you would need to specify serverX.peoplesoft.com/servlets, not serverX/servlets.

**Cross Domain Single Signon**

The current PeopleSoft single signon solution deals mainly with systems where there is only one DNS domain. Many sites need to deploy the PeopleSoft Portal in multi-domain environments. For example, you might want to have the portal in one domain—www.PSFT_ecenter.com, for example—and the HCM database in another domain, such as www.yourcompany.com.

You can configure your environment to support cross-domain single signon by completing the following configuration tasks.

- Setup a third-party web security product that supports multi-domain single signon and supports LDAP user profiles.

  There are several industry-standard products on the market.

- Configure the portal and content provider web servers to trust the web server for authentication.

  For PeopleSoft software, this involves enabling the public access feature.

- Set up the PeopleSoft systems to download the user profiles from the same LDAP server that the web security product uses.

  This means that the DN that comes from the subject field of the certificate has to be a valid DN for the directory that the LDAP_profilesynch function references. Because of this you need to build a user profile cache map that points to the same directory that generated the subject’s DN.
**Note.** This cross-domain limitation does not apply to the portal if the content from the provider in a different domain is wrapped in an HTML template. However, this limitation does apply for any content in the portal that is wrapped in a frame template. Because the Enterprise, Customer, Supplier, and Employee portals shipped with PeopleTools all include frame templates as defaults, you’ll need to perform the extra configuration steps to support cross-domain single signon in multi-domain environments. This limitation also applies to Pure Internet Architecture-to-Pure Internet Architecture (iClient-to-iClient) single signon.

**PeopleSoft-Only Single Signon Configuration Examples**

The following topics describe examples of single signon configurations and the steps required to implement them.

**One Database and Two Web Servers**

In this scenario there is one database and two or more web servers. While single signon is configured at the database level (that is, you specify timeout minutes and trusted nodes for the entire database), it’s actually used any time two different PeopleSoft servlets connect to the same database.

To set up single signon with one database and multiple web servers:

1. Select PeopleTools, Portal, Node Definitions and make sure that at least one node is defined as the Default Local Node.

   In the results on the search page, you can determine this by looking for a Y in the Default Local Node column.

2. Select PeopleTools, Security, Security Objects, Single Signon and set the following:
   
   • Make sure the Default Local Node appears in the list under Trust Authentication Tokens issued by these Nodes.
   
   • Set the timeout minutes to an appropriate value (the default is 720).

3. Access the web profile for each web server and modify the Authentication Domain property.

   Because single signon is implemented using browser cookies, it must be configured so that the user’s browser sends the single signon cookie to each web server machine involved. By default, the browser only sends cookies back to the machine that set the cookie. So if web server a.peoplesoft.com sets a cookie after the user is authenticated, the browser (by default) only sends the cookie to a.peoplesoft.com. By default, the browser would not send the cookie to b.peoplesoft.com. To make the browser send the single signon cookie to all servers at a domain (peoplesoft.com), access the Web Profile Configuration - General page and set a value of .peoplesoft.com for the Authentication Domain property.

   **Note.** You need the leading period (.) before the domain. It should appear as “.peoplesoft.com,” not “peoplesoft.com.”

   If you use only one web server, you don’t need to modify the Authentication Domain property. A web server is designed to accept the cookies it distributes.

**Two Databases and Two Web Servers**

To set up single signon with multiple databases and multiple web servers:

1. Select PeopleTools, Portal, Node Definitions for each node that you want to involve in the single signon configuration and check the following:
• Make sure that at least one node definition is defined as the Default Local Node for each database. In the results on the search page, you can determine this by looking for a Y in the Default Local Node column.

• Make sure that each database contains a node definition for the other nodes in the single signon configuration.

• Make sure that the Authentication Option is set correctly.
  For example, if you are using password authentication make sure that the node password for node ‘X’ is the same in each node definition for node ‘X’ in each database.
  You should use digital certificate authentication. Make sure the certificates are properly installed in the PeopleSoft Keystore before setting the node’s Authentication Option to Certificate.

2. Select PeopleTools, Security, Security Objects, Single Signon and set the following:
  • Make sure the Default Local Node appears in the list under Trust Authentication Tokens issued by these Nodes.
  • Set the timeout minutes to an appropriate value (the default is 720).

3. Access the web profile on your web server and modify the Authentication Domain property.
  Because single signon is implemented using browser cookies, it must be configured so that the user’s browser sends the single signon cookie to each web server machine involved. By default, the browser only sends cookies back to the machine that set the cookie. So if web server a.peoplesoft.com sets a cookie after the user is authenticated, the browser (by default) only sends the cookie to a.peoplesoft.com. By default, the browser would not send the cookie to b.peoplesoft.com. To make the browser send the single signon cookie to all servers at in a domain (peoplesoft.com), modify the authentication domain as follows.

**Single Signon with Third Party Authentication**

This section presents a simple example of how to implement single signon when you have implemented a third-party authentication system at the web server level. This applies to both portal and intranet web servers.

---

**Note.** This example does not cover authentication. This example assumes that you have set up your third-party authentication correctly. Third-party authentication is out of the scope for PeopleSoft support and documentation.

---

**Note.** Also, this discussion assumes that you have enabled public user access in the web profile for the appropriate site.

For PeopleSoft application single signon, the PeopleSoft system needs to know the user ID to be used for the web session. If implementing this configuration, you are required to address the following:

1. Authenticate the web user.
2. Determine which PeopleSoft User ID to use for this web user.
3. Send the User ID to the PeopleSoft application server.
4. Write signon PeopleCode to retrieve the User ID from wherever step 3 sent it.
5. Reauthenticate the User ID during signon PeopleCode.
6. Indicate to the PeopleSoft application server to use the User ID for all subsequent service requests.

The following examples address items 3, 4, and 6.

The following HTML applies to step 3 above. You can change the JavaScript function to set the cookie name and value that you want. Also, change the location to point to the PeopleSoft page to which you want to redirect users, for example:

```html
<html>
<head>
<title>PeopleSoft 8 Single Sign-On Example</title>
</head>

<!--
PeopleSoft 8 Single Sign-On Example

In this example, security is non-existent. In a production system, the UserID could come from your site’s single signon tool. Other information could also be included. For this example, only the UserID is saved into cookie. This cookie then gets sent to the PIA Web Servlet which passes it on to the PeopleSoft Application Server. A piece of signon PeopleCode is needed to extract the UserID from the cookie and call SetAuthorizationResult in order to "sign on" the user.

- Change the domain value of the cookie to your domain.
- Change the location ref to the target URL within your PeopleSoft site.
//-->

<body>
<script language=JavaScript>
var cookie = "ThirdPartyUserId=PS; Domain=.peoplesoft.com; path=/; MaxAge=1";
document.cookie = cookie;
location="https://hcm.peoplesoft.com/servlets/iclientservlet/hrdb/?ICType=Panel&Menu=ROLE_EMPLOYEE&Market=GBL&PanelGroupName=IT_TIME_OFF&RL=&target=main1"
</script>
</body>
</html>
```

The following Signon PeopleCode example applies to steps 4 and 6 above. The Signon PeopleCode needs to retrieve &UserID from where the third-party portal put it in the HTTP Request. For example,

Function SSO_EXAMPLE()

/*This is step 4*/
&TPUserID = %Request.GetCookieValue("ThirdPartyUserId");
/*This is step 6*/
If &TPUserID <> "" Then
    SetAuthenticationResult( True, &TPUserID, ",", False);
End-If
End-Function;
After you write the program, you need to enable the program using the Signon PeopleCode page. (PeopleTools, Security, Security Objects, Signon PeopleCode.

**Making the PeopleSoft-Only Single Signon Token Secure**

PeopleSoft single signon functionality also applies at the web server level. For example, let’s say that you have two web servers: server X and server Y. Assume that web server X is a SSL site, and assume that web server Y is not. In these situations, many organizations want server Y to trust the authentication token, PS_TOKEN, issued by server X. This requires that the PS_TOKEN be set to be secure.

If the PS_TOKEN is not marked as secure, then when a user signs on through server Y, the browser sends PS_TOKEN to server Y over the unencrypted, non-SSL link. This is typical behavior for browsers when dealing with non-secure cookies. Potentially, in this situation a hacker could identify this token from the clear network and use it to sign on to the SSL-secure server X.

Another important use of this feature relates specifically to the PeopleSoft Portal. When the portal proxies content with an HTML template, it should forward PS_TOKEN cookies that are marked secure only over SSL connections.

To resolve this potential security issue, select the Secure Cookie with SSL check box on the Web Profile Configuration - Security page. You use this property to control the secure attribute of the single signon cookie. If you enable the property, and the scheme of the current request is HTTPS (an SSL server), the system sets the secure attribute of the single signon cookie (PS_TOKEN) to true. This prevents the single signon token from travelling over an insecure network.

**Note.** If you enable this property, you are effectively disabling single signon to any non-SSL servers.

If, at your site, you want users to signon to an HTTPS server, and then want to do single signon with HTTP servers, set this property to false, which allows single signon between HTTPS and HTTP servers.

**Note.** If you can tolerate the security risk, and want single signon between secure and non-secure links, you can set this flag to false. However, before doing this you need to make sure you are aware of all the security implications, such as the security of the HTTPS server may be compromised.

**Using the Single Signon API**

PeopleSoft provides a component interface named PRTL_SS_CI that enables external applications to seamlessly integrate a single signon solution with the PeopleSoft portal applications. This ensures that users who have already signed in to the portal don’t have to sign in again for every system you reference in your portal.

To take advantage of the Single Signon API, you need to create a custom API, which includes building the dynamic link libraries, classes, and registry settings necessary to enable an external application to communicate with PeopleSoft software.

**Note.** Due to constraints imposed by the PeopleCode SwitchUser built-in function, PRTL_SS_CI does not work properly when called from PeopleCode. Only external applications, such as Java, Visual Basic, and C/C++ programs, can access PRTL_SS_CI.

The files of your custom API need to reside on the client machine; that is, the web server for ASP, and the machine running the Java program for Java. The registry file may also need to be executed to update the registry with the new libraries.
Understanding the Signon Process with the API

The PRTL_SS_CI Component Interface contains two user-defined methods:

- **Authenticate**
  
  Your external authentication program distributes an authentication token that can be retrieved from a cookie in the browser. The Authenticate function determines if an authentication token is valid.

- **GetUserID**
  
  If the token is valid, you use the GetUserID function to retrieve the User ID associated with the authentication token.

Before we describe the development requirements of your API, PeopleSoft recommends that you take a moment to examine the steps that occur internally when you use the API in conjunction with the delivered PRTL_SS_CI.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The user enters the User ID and password into the PeopleSoft Portal signon page.</td>
</tr>
<tr>
<td>2</td>
<td>If the login on portal application server is successful, the server generates a single signon token. The web server receives the single signon token from the application server, and issues a cookie to the browser.</td>
</tr>
<tr>
<td>3</td>
<td>The user navigates in the portal and encounters a hyperlink to the external system. The user clicks on the link.</td>
</tr>
<tr>
<td>4</td>
<td>The browser passes the PS_TOKEN cookie to your external web server.</td>
</tr>
<tr>
<td>5</td>
<td>The external web server checks for the PS_TOKEN cookie before displaying a signon page.</td>
</tr>
<tr>
<td>6</td>
<td>Once it is determined that the user is accessing your application through the PeopleSoft portal, you retrieve the authentication token and send it to the PRTL_SS_CI component interface to verify authentication.</td>
</tr>
<tr>
<td>7</td>
<td>After the system authenticates the token, the system can then make calls to the PRTL_SS_CI.Get_UserID function to return the appropriate User ID.</td>
</tr>
</tbody>
</table>

Developing your External Application to Support Single Signon

Developers of the external applications need to alter the signon process to conform to the following requirements.

1. Check for the PS_TOKEN cookie.
   
   If the cookie doesn’t exist, continue with your normal signon process. Otherwise, bypass the signon screen.

2. Retrieve the authentication token from the PS_TOKEN cookie.
3. Make a connection to the PeopleSoft system through the PRTL_SS_CI API.
4. Pass the authentication token to the Authenticate function of the API.
5. If Authenticate returns True, you then retrieve the User ID associated with the authentication token by using the Get_UserID function.

Note. The component interface is not mapped to data because the key field for the data would be the authentication token. This token is dynamically assigned when the user signs on to the portal, and it is not stored anywhere in the system as data. Therefore, there are no key fields and the token is passed directly to the user defined functions.

Configuring PeopleSoft-Only Single Signoff

In addition to single signon, the PeopleSoft system also signs the user off of content providers when the user signs off. However, there are some exceptions to the sign-off functionality.

The portal only signs off content providers that meet the following criteria:

- Content providers are accessed only through HTML templates.
- Content providers are all PeopleSoft 8.x applications.

This means that for content providers accessed through frame templates, single sign-out is not automatically enabled when you configure single signon. This section describes the steps you need to complete to configure single sign-off for content providers being accessed through frame templates, which includes all of the PeopleSoft Portal solutions (Employee, Customer, and so on).

The following procedure covers inserting an HTML image tag (img) containing a logout command into a set of files on the web server. When the user signs off, the browser attempts to download the images using an "HTTP get," which causes the system to send the logout command to each specified content provider.

This procedure is not appropriate for content that is never accessed using a frame, as in it is accessed from the content source using an iScript and a business interlink, such as Lotus Notes integration.

To configure single sign-off for frame content:

1. On your web server, locate and open signin.html.
2. Open signin.html, select Save As, and enter the name signout.html.
3. Open signout.html, expire.html, and exception.html.
4. Add the following image tags to these files.

You need to add one image tag to each of these files for each content provider that requires single signoff.

Add the tags just before the closing body tag, as shown:

```html
<! add tags here>
</body>
```

If you have three content providers that require single signoff, such as HCM, FIN, and HTML Access, you need to add three image tags to each file.

For example:

```html
<IMG src="http://hcm.peoplesoft.com/servlets/psp/ps/hrdb/?cmd=logout" height=0 width=0 border=0>
<IMG src="http://fin.peoplesoft.com/servlets/psp/ps/hrdb/?cmd=logout"
```
The previous code is an example. To determine the exact URL you need to add for your implementation, right-click the logout link of each content provider. You can usually view the logout link when accessing the application outside of the portal. Examine the properties of this link, and add the specified URL to the image tag.

**Note.** The string "cmd=dummy" is required in the image tag for HTML Access to make sure that the browser doesn’t attempt to cache the image, which would prevent it from issuing the logout command.

5. In PIA, select PeopleTools, Web Profile, Web Profile Configuration, Look and Feel on your web server. In the Signon/Logout Pages group box, change the value of the Logout Page field to `signout.html`.

---

### Implementing Single Signon Between PeopleSoft and Oracle Applications

This section provides an overview and discusses how to:

- Implement Oracle as a trusted node.
- Implement Oracle as a partner application.

**Note.** The additional software (as in, SSOPlugin and PSTokenClear) required to implement single signon between PeopleSoft and Oracle applications is in the following location of your PeopleTools installation: `<PS_HOME>`\SecurityAddIns\OracleSSO.

### Understanding Single Signon Between Oracle and PeopleSoft Applications

It is assumed that anyone configuring single signon between PeopleSoft and Oracle is familiar with the Oracle system and its delivered documentation as well as the single signon functionality of PeopleSoft. This documentation covers the required elements you need to configure and provides configuration examples. Keep in mind that you may vary the implementation to meet the requirements of your system.

Components and concepts of the Oracle system that you should be familiar with include:

- Oracle Single Signon Server.
- Oracle Internet Directory.
- Oracle Identity Management Infrastructure.
- `mod_osso`.
- Partner and external applications.

Specifically, you should be familiar with the information within *Oracle Application Server Single Sign-On Administrator's Guide*. 
Implementing Oracle as a Trusted Node

Because PeopleSoft applications use the PS_TOKEN cookie as the method of verifying user credentials, in order for users of Oracle applications to access PeopleSoft applications, they need the PS_TOKEN cookie in their browser. Oracle applications use the PS_TOKEN plug-in to generate a domain-level PS_TOKEN cookie that PeopleSoft accepts as a user credential. With this plug-in in place, you can configure any PeopleSoft application to trust the Oracle system as a single signon node. In this configuration, you must create PeopleSoft node definitions for each of the participating Oracle applications.

Implementing Oracle as a trusted node, involves the following items:

- Oracle SSO server.
- mod_osso.
- PS_TOKEN plug-in, which generates the PS_TOKEN cookie on the Oracle system.

Note. PeopleSoft digital certificates cannot be used for single signon authentication for this configuration.

See Oracle HTTP Server Administrator’s Guide for information on setting up proxy and reverse proxy configurations.

Viewing the Single Signon Elements Interact

To illustrate how the elements of this single signon configuration interact, this section describes a scenario of a user accessing PeopleSoft applications from a link in Oracle applications.

1. User accesses the Oracle application.
2. The Oracle Single Signon server authenticates the user and distributes a PS_TOKEN cookie.
3. User clicks a link in the Oracle application that is pointing to a PeopleSoft application.
4. The mod_osso Oracle Apache module intercepts the request for access to PeopleSoft applications.
5. The mod_osso Oracle Apache module redirects the user to the appropriate PeopleSoft page.
6. The PeopleSoft application authenticates the Oracle application user, by examining the PS_TOKEN cookie generated by the Oracle system.

Example: Setting Up Oracle as a Trusted Node

There are a variety of ways you can setup Oracle as a trusted node for single signon. This section provides an example of one approach to this configuration, providing a sample procedure for setting up Oracle as a trusted node using a URL link in an HTML page to a PeopleSoft application.

Note. You can also configure the Oracle HTTP server to use a proxy/reverse proxy server to redirect users to the PeopleSoft application. For example, you could setup a reverse proxy such that a certain URL pattern will be reconstructed to a real PeopleSoft URL.

To set up Oracle as a trusted node using a URL link in an HTML Page:

1. Make sure that Oracle Internet Directory and Oracle Single Signon Server have been installed.
2. Add the appropriate PeopleSoft application as a partner application.
   Access the Sever Administration page (http://<OIDserver>:<port>/pls/orasso), and click Administer Partner Applications.
3. Install the PS_TOKEN plug-in onto the Oracle Single Signon server.
Chapter 8 Implementing Single Signon

The PS_TOKEN plug-in is contained in the ssoplugin.zip, which needs to be extracted into the ORACLE_HOME/sso directory.

a. Unzip ssoplugin.zip into the ORACLE_HOME/sso directory.

b. Edit the tokengen.ini file and assign the appropriate values to these parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>NodeName</strong></td>
<td>The name of the Oracle node generating the PS_TOKEN cookie. This is the node that PeopleSoft will be configured to trust.</td>
</tr>
<tr>
<td><strong>NodePwd</strong></td>
<td>The password associated with the NodeName.</td>
</tr>
<tr>
<td><strong>TokenDomain</strong></td>
<td>The domain for your site, such as .mycompany.com.</td>
</tr>
</tbody>
</table>

Note. Ignore the other parameters in the file; they are not used for this configuration.

4. Add the node specified in the previous step to the list of trusted nodes on the Single Signon page in your PeopleSoft application.

5. On the Oracle HTTP Server, create an HTML page with links to the PeopleSoft application. For example, assume this HTML appears in the file psft_link.html:

```html
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0 Transitional//EN">
<html>
<head>
<title>A link to PeopleSoft</title>
</head>
<body bgcolor=#006633 topmargin="0" leftmargin="0" marginheight="0" marginwidth="0"
onload="preloadImages();">
/MAINTAIN_SECURITY.PSDSSETUP
.GBL?FolderPath=PORTAL_ROOT_OBJECT.PT_PEOPLETOOLS.PT_SECURITY.PT_DIRECTORY.PT⇒
PSDSSETUP_GBL&IsFolder=
false&IgnoreParamTempl=FolderPath%2cIsFolder"
>PeopleSoft</a>
</body>
</html>
```

6. Modify the mod_osso.conf file, located in ORACLE_HOME/Apache/Apache/conf. Make sure you modify the location and the HTML file name accordingly based on your configuration. For example,

```xml
<Location /psft_link.html>
    require valid-user
    AuthType Basic
</Location>
```

7. Modify the policy.properties file, located in ORACLE_HOME/sso/conf. Add the following parameters:

```properties
CustomCookie_ProviderPlugin = peoplesoft.security.ssoplugin.PSToken
CustomCookieAuthLevel = MediumSecurity
```

8. Restart the Oracle HTTP Server and the Oracle OC4J_SECURITY instance.
9. Add a URL link in your Oracle application to the page you created (in this case psft_link.html).

Implementing Oracle as a Partner Application

To set up Oracle as a partner application, you must be running the PeopleSoft applications on Oracle Application Server 10g. Neither PeopleSoft node definitions nor PeopleSoft digital certificates are required for this single signon option. All single signon authentication is provided by the Oracle system, which requires additional configuration to interoperate with PeopleSoft. This single signon approach takes full advantage of the Oracle Apache module, mod_osso. As such, this option is more in line with how a partner application is typically integrated with the Oracle Single Signon Server (as opposed to using the PS_TOKEN plug-in option, which is tailored for sites running their PeopleSoft applications on BEA WebLogic or IBM WebSphere).

Setting up Oracle as a partner application is similar to using the WWW_AUTHENTICATION signon PeopleCode function in PeopleSoft applications, where you trust another system’s authentication. In this case, the authentication PeopleSoft trusts comes from mod_osso.

See Enterprise PeopleTools 8.49 PeopleBook: Security Administration, Employing Signon PeopleCode and User Exits.

Before you begin configuring this single signon option, the following items need to be in place:

- Oracle Application Server 10g needs to be installed.
  See Oracle Application Server Administrator’s Guide.
- It is recommended (but not required) to have SSL enabled on Oracle Application Server 10g.
  See Oracle Application Server Administrator’s Guide.
- PeopleSoft Internet Architecture needs to be installed on Oracle Application Server 10g.
  See Enterprise PeopleTools Installation Guide for your platform
- If you are using Oracle Identity Management (10.1.2 or 10.1.4), you must manually configure your OAS Release 3 (10.1.3) middle-tier instance to use Oracle Identity Management.
  See Oracle Application Server Administrator’s Guide 10g Release 3 (10.1.3), “Configuring Instances to Use 10.1.2 and 9.0.4 Oracle Identity Management”
  See Oracle Application Server Single Sign-On Administrator’s Guide 10g (10.1.4.0.1) “Configuring and Administering Partner Applications.

Setting up Oracle as a Partner Application

To set up Oracle as a partner application:

1. Configure Oracle Application Server to use the Oracle Single Signon Server.
   Access the Oracle Enterprise Manager’s Infrastructure tab, and click the Change button in the Identity Management section to specify the appropriate Oracle Single Signon Server.

   **Note.** This only needs to be completed once per Oracle Application Server installation. You do not need to perform this for each PeopleSoft installation on the Oracle Application Server.

2. Create a default user ID, just as you do when implementing the web server security exit in PeopleSoft.

3. Modify the web profile to contain default user signon information, and make sure it is set to Allow Public Access.

Make sure to refer to the same user ID you created previously.

To prevent a user ID from being the default user on the signon page, set the Days to Autofill User ID property to 0.

See Enterprise PeopleTools 8.49 PeopleBook: Internet Technology, Configuring the Portal Environment, Configuring Web Profiles, Configuring Portal Security

You have these options:

• You can write your own custom PeopleCode program to create the user as needed.

• You can also make sure that the OID user information exists in PeopleSoft, which can be done with a delivered Signon PeopleCode function. This option requires you to make sure that user profiles that exist in the Oracle Internet Directory are also defined in PeopleSoft. PeopleSoft provides the OSSO_AUTHENTICATION Signon PeopleCode function to get user profile and role information from the Oracle Internet Directory. To use it, add and enable OSSO_AUTHENTICATION in the FUNCLIB_LDAP record definition using the Signon PeopleCode page (PeopleTools, Security, Security Objects, Signon PeopleCode). It is recommended that you modify the entry for SSO_AUTHENTICATION and change the function name to OSSO_AUTHENTICATION. This avoids mixing single signon options. In your Signon PeopleCode program, modify the getWWWAuthConfig() function to assign the value of the default user you created to the &defaultuserId variable.

Note. Make sure that OSSO_AUTHENTICATION appears before LDAP_PROFILESYNC in the grid on the Signon PeopleCode page.

5. Configure LDAP authentication on your PeopleSoft system to use the Oracle Internet Directory.

This includes setting up directory schema caching, user profile maps, authentication maps, and so on.

See Enterprise PeopleTools 8.49 PeopleBook: Security Administration, "Employing LDAP Directory Services"

For example,

```<Location /PORTAL>
  require valid-user
  AuthType Basic
</Location>
```

7. Restart Oracle Application Server and Oracle Internet Directory.

8. If you are integrating PeopleSoft with JPDK, make sure to configure the PeopleSoft container to expect single signon with Oracle set up as a partner application.
This is done by setting the `<context-param>` to true. You find this parameter in the web.xml file of the /pspc web application within the PeopleSoft domain on the OAS instance acting as the web provider for the Oracle Portal. Setting the `<context-param>` to true enables the portlet container to respond to SSO information coming from the Oracle Portal rather than requiring a PeopleSoft signon for each JPDK portlet.

```xml
<context-param>
  <param-name>EnableJPDKSingleSignon</param-name>
  <param-value>true</param-value>
</context-param>
```

**Note.** This parameter only applies to JPDK portlets within the Oracle Portal. It does not affect WSRP technology.

### Example: Sample PeopleCode For Setting up Oracle as a Partner Application

This section illustrates how PeopleCode may be used to configure Oracle as a partner application.

You can retrieve user information from the HTTP headers, as follows:

```pcode
%Request.getHeader("Osso-User-Dn");
```

The following PeopleCode shows an example of signon PeopleCode that could be used in conjunction with the LDAP_PROFILESYNCH option.

```pcode
Function OSSO_AUTHENTICATION()
  If %PSAuthResult = True And
    &authMethod <> "LDAP" And
    &authMethod <> "WWW" And
    &authMethod <> "SSO" Then
    getWWWAuthConfig();
    &tempUser = %SignonUserId;
    If %SignonUserId = &defaultUserId Then
      &global_DN = %Request.GetHeader("Osso-User-Dn");
      If &global_DN <> "" Then
        If &bConfigRead = False Then
          getLDAPConfig();
        End-If;
        For &I = 1 To &authMaps.Len
          &userId = DNToId(&global_DN, &authMaps [&I]);
          If &userId <> "" Then
            SetAuthenticationResult( True, Upper(&userId), "", False);
            &authMethod = "OSSO";
            &idxAuthMap = &I;
            Return;
          End-If;
        End-For;
      End-If;
    End-If;
  End-If;
End-Function;
```
Function LDAP_PROFILESYNCH()
If &global_DN <> "" Then
  If &bConfigRead = False Then
    getLDAPConfig();
    End-If;
  updateUserProfile();
  End-If;
End-Function;

Implementing Single Sign off between Oracle and PeopleSoft Applications

Whether you have configured Oracle as a trusted node or a partner application, it is recommended that you also configure single sign off, which enables the system to log out users from both applications (Oracle and PeopleSoft) when a user logs out of either application. This ensures that there are not orphan sessions open that can hamper performance and increase security risks.

Implementing Single Signoff Initiated by Your PeopleSoft Application

Setting up single signoff initiated by PeopleSoft refers to setting up the PeopleSoft system to sign users off of the Oracle system when they sign off from the PeopleSoft system. To do this, PeopleSoft recommends redirecting the user to the Oracle SSO server’s single signoff page/servlet when the logout event on PeopleSoft occurs. In the Oracle system, when a user signs off of one partner application, the Oracle SSO server’s signoff page (osso_logout servlet) terminates a single signon session and logs the user out of all active partner applications simultaneously.

Note. PeopleSoft recommends using this approach whether you’ve implemented single signon with Oracle as a trusted node or Oracle as a partner application.

In your PeopleSoft system, you can modify the web profile Logout Page value (on the Look and Feel tab in the Signon/Logout group box) to point to an HTML page designed to redirect a user to the Oracle SSO server’s osso_logout servlet. The following is an example of the HTML in the logout page that redirects the user to the Oracle SSO logout page/servlet.

```html
<html>
<head>
<title></title>
</head>
<body>
<meta content="0; URL=http://pt1.peoplesoft.com:7777/osso_logout" http-equiv="Refresh">
</body>
</html>
```

Note. This is just an example of one approach. There are other technologies and approaches that could be used to achieve the same task of redirecting the user to Oracle SSO server’s single signoff URL.
Removing PS_TOKEN Cookies

Configuring single signoff between Oracle and PeopleSoft requires you to install the PSTokenClear servlet. This servlet needs to be installed whether you’ve configured Oracle to be a trusted node or a partner application. A PS_TOKEN cookie gets generated using either single signon option. The PSTokenClear servlet ensures that no PeopleSoft authentication token information exists in the browser after a user has signed off.

The PSTokenClear servlet is delivered as an .ear file. To install it on your Oracle system, use the Oracle Enterprise Manager to deploy the .ear file by following the steps outlined in the Oracle documentation describing the installation of OC4J applications.

**Note.** The server on which you install PSTokenClear depends on the way you’ve configured single signon. If you’ve configured Oracle as a trusted node, install PSTokenClear on the Oracle SSO server. If you’ve configured Oracle as a partner application, install PSTokenClear on the Oracle Application Server.

The following table distinguishes the behavior and purpose of the PSTokenClear servlet depending on your configuration.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Location Installed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle as a trusted node</td>
<td>Oracle SSO Server</td>
<td>Clears the PS_TOKEN cookie from the browser when the user has signed off from the Oracle system. With no PS_TOKEN cookie the user is effectively signed off from the PeopleSoft system. For this configuration, the PSTokenClear servlet is installed on the Oracle SSO server because in this configuration, the PeopleSoft SSO plug-in installed on the Oracle SSO server is the component generating the PS_TOKEN cookie.</td>
</tr>
<tr>
<td>Oracle as a partner application</td>
<td>Oracle Application Server</td>
<td>When Oracle is configured as a partner application and a user signs off from the Oracle system, the PSTokenClear servlet removes the PS_TOKEN cookie when the Oracle SSO server performs a logout.</td>
</tr>
</tbody>
</table>

If you are installing the PSTokenClear servlet on the Oracle SSO server for the “trusted node” option, you need to:

- Set the PeopleSoft sign off URL on the Partner Application Login page (in Enterprise Manager) to point to the PSTokenClear servlet.
- Set the cookieDomain and cookiePath the same as the cookie domain in tokengen.ini.
- Set the redirectURL parameter to point to the URL of the osso_logout_success page on the Oracle Application Server to complete signon signoff from Oracle SSO.

For example:

If you are installing the PSTokenClear servlet on the Oracle Application Server for the “trusted node” option, you need to make sure that you replace the logout_success_url with the URL pointing to the PSTokenClear servlet. For example:

CHAPTER 9

Working with SSL and Digital Certificates

This chapter provides an overview and discusses how to configure digital certificates.

Understanding SSL and Digital Certificates

The PeopleSoft system takes advantage of HTTPS, Secure Sockets Layer (SSL), and digital certificates to secure the transmission of data from the web server to an end user’s web browser and also to secure the transmission of data between PeopleSoft servers and third-party servers (for business-to-business processing) over the internet.

PeopleSoft customers can implement PeopleSoft software using HTTP or HTTPS. The native SSL support in commercially available web browsers and web servers is used to provide HTTPS communication between the web browser and web server.

Understanding SSL

With business-to-business applications, where systems communicate with each other over the internet, data must flow securely. As such, system-to-system authentication is critical. PeopleSoft uses HTTPS and digital certificates for secure transmission of data between systems and system-to-system authentication. PeopleTools use the inherently supported SSL implementation provided with JRE.TM

The PeopleSoft system uses Extensible Markup Language (XML) messaging over HTTPS for our Integration Broker and Business Interlink technologies to deliver system-to-system integration over the internet. HTTPS is used to guarantee secure transmission of the XML message. The digital signature of the XML message is used for authentication between systems. With digital certificates, XML messages are digitally signed to prove that the message came from the server that created and signed the message and to prove the message has not been altered.

The following table shows the PeopleSoft technologies that use HTTPS / SSL and how it is implemented in each technology.

<table>
<thead>
<tr>
<th>Technology</th>
<th>How HTTPS/SSL is Implemented</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeopleSoft Portal Solutions</td>
<td>Secure page transport — Uses web server platform to provide server side SSL.</td>
</tr>
<tr>
<td></td>
<td>Secure access to remote content providers — Application server uses JRE to provide the client side of SSL connection to gateway. Uses web server platform to provide server side SSL.</td>
</tr>
</tbody>
</table>
How HTTPS/SSL is Implemented

Understanding Certificate Authorities

Anytime you implement SSL with mutual authentication (both client and server authenticate each other) you need the following three items:

- Server Certificate (issued by some trusted third party or certificate authority).
- Client Certificate (issued by the same trusted third party or certificate authority).
- Client and server both need a copy of a root certificate for the trusted third party. The root certificate has the crypto keys (public and private key) of the authority. Using these keys and the client and server certificates, each party is able to authenticate the other.

When you logon to an SSL server using your browser, you don’t have to worry about a Root Certificate because they come bundled with the browser. You don’t have to worry about having a client certificate because the web server doesn’t require “Client Side Authentication”.

Important! When you are importing a digital certificate, you may receive an error message if you attempt to import the digital certificate immediately after downloading it from a certificate authority. This is due to issues related to "valid from" dates and times, and the inconsistencies in time settings between different computers. You should save the certificate to a Microsoft Windows 2000/NT workstation, right click on it using Microsoft Windows Explorer, and select Open. This opens the Certificate dialog box. Examine the information regarding the “valid from” and “to” dates. Make sure those dates are valid on the application server the certificate will be installed on. The Details tab on the Certificate dialog presents the most thorough information.

Configuring Digital Certificates

The Digital Certificates page displays your inventory of server-side digital certificates. This page also enables you to import new certificates from a certificate authority.
Note. For user certificates, no redundant setup of user certificates is required. With a few lines of Signon PeopleCode, you can reuse the existing PKI server that you have in place.

Note. Currently, root CA key size is limited to 1024 bits.

To view details regarding a particular certificate, click Details.

**Type**

Select the type of certificate.

*Local Node.* Select this option when you are setting up a local node for the PeopleSoft messaging system (PeopleSoft Integration Broker).

*Root CA.* Select this when you are adding a new Root CA to your key store.

*Remote.* Select this option when you are setting up a remote node for the PeopleSoft messaging system (PeopleSoft Integration Broker).

**Alias**

Enables you to add a custom alias for identification purposes.

**Issuer Alias**

Contains the alias of the authority that issued the certificate.

**Valid To**

Shows how long the certificate is valid for use.

**Detail**

Launches a sub-page with more certificate information. The Certificate Detail page reveals subject and certificate information so you can determine such characteristics as the serial number, the fingerprint, the encryption algorithm, and so on.

Note. Depending on the type of certificate you’re adding, this link might be displayed as Add Root, Import, or Request.

**Note.** When adding a Local Node certificate and you click the Import link, the Request New Certificate page appears in which you need to add Subject information (Organization, Locality, and so on) and Key Pair information (encryption algorithm, and key size).
Understanding WS-Security

By implementing the WS-Security standard, PeopleSoft provides the ability to leverage emerging XML security technologies to address web services security requirements. WS-Security provides:

- A way for applications to construct secure SOAP message exchanges.
- A general-purpose mechanism for associating security tokens with SOAP messages.
- XML message integrity and confidentiality.

By providing WS-Security capabilities, you can leverage the standard set of SOAP extensions, that you use when building secure web services, to implement message content integrity and confidentiality. WS-Security provides a way to insert and convey security tokens in SOAP messages. The ability to leverage WS-Security standards provides for better interoperability and improved usability, enabling the implementation of robust security within a WSRP-capable environment. The solutions being provided through the PeopleSoft WS-Security implementation include:

- Single Signon solution between WSRP consumer and producer.
  The web services consumer passes the appropriate identification to a producer as part of the SOAP message, so that producer can verify the identity in order to execute requested web services on behalf of the user without requiring a user to log in. Single signon between web services consumer and producer feature is currently supported in PeopleSoft WSRP Portal, PeopleSoft Integration Broker, and BPEL product.
- SOAP message integrity. Ensuring that messages have not been tampered with
- SOAP message confidentiality. Guaranteeing that messages are protected against eavesdroppers.

The WS-Security UsernameToken Profile defines a standard way to associate user ID and password information in the SOAP messaging for web services interoperability.

The PeopleSoft portal solution provides support for WS-Security for single-signon with third party applications—limited to user authentication using username/password or user authentication using username and digital signature through the use of Web Services Security: UsernameToken Profile.

Note. PeopleSoft provides multiple levels of security for WSRP. These levels, or options, are discussed in the following chapter. PeopleSoft recommends that you determine the level that is appropriate for your needs before implementing WS-Security. Using SSL connections to secure transmissions may be sufficient.
This figure shows how WS-Security inserts and conveys security tokens in SOAP messages:

Implementing WS-Security for WSRP

If using the web services for remote portals technology, you implement WS-Security.

See Enterprise PeopleTools 8.49 PeopleBook: Internet Technology, “Configuring WS-Security For WSRP Consumption and Production”.

Implementing WS-Security for PeopleSoft Integration Broker

If using PeopleSoft Integration Broker, you configure WS-Security to ensure secure transmissions.

Chapter 11

Encrypting Text With PSCipher

This chapter contains an overview and discusses how to:

• Use the PSCipher utility.
• Generate a unique encryption key.
• Update the encryption key on Oracle Application Server.
• Update the encryption key on BEA WebLogic.
• Update the encryption key on IBM WebSphere.
• Secure the external key file.

Understanding the Triple DES Encryption Implementation

The PSCipher utility provides Triple DES encryption (also 3DES) for increased data security. When you install Enterprise PeopleTools on your application servers and web servers, a default, Triple DES encryption key is provided. If your site decides to use the default key, no further configuration of your system is required to implement Triple DES encryption. However, if your site requires or desires a unique encryption key, you can generate a unique key using the PSCipher command line utility as described in this chapter.

The version of the default encryption key is version 1.1, or {V1.1}. If you generate a unique key, the current version used by the system would be {V1.2}. Each time you generate a new key, the system increments the current version number.

Using the PSCipher Utility

The PSCipher feature encrypts and decrypts text used in your PeopleSoft system. System administrators interact with PSCipher through a Java, command line utility located on the web server, which enables you to encrypt text, such as user IDs and passwords, stored in configuration files. PSCipher also involves a runtime element, running on the application server, that decrypts the encrypted text. The runtime element requires no user interaction.

In previous releases, PSCipher was used, for example, to secure the node IDs and node passwords used in conjunction with PeopleSoft Integration Broker configurations. You can now use the PSCipher command line utility to encrypt (with Triple DES) a variety of text values stored in various configuration files throughout your system. In addition, PSCipher also provides:

• Key generation: You can generate unique encryption keys if you do not want to use the default key.
• Version maintenance: The key file maintains a version history of all previous versions of the key file, which enables text encrypted with a previous version to be decrypted.

Note. PSCipher decrypts text encrypted in previous releases. For example, PSCipher in Enterprise PeopleTools 8.49 supports text encrypted with PSCipher in Enterprise PeopleTools 8.46.

To encrypt text, you submit text values in the form of arguments that PSCipher encrypts and then displays in its encrypted form. Suppose you needed to encrypt a user ID of "HRDMO" and a password of "DMPGSWD". You would submit these values to PSCipher as follows:

...\pscipher HRDMO

and

...\pscipher DMPGSWD

PSCipher returns the encrypted form of these submitted text values, which you can then copy to a configuration file to assign to a configuration parameter.

For example, on Oracle Application Server you will need to encrypt the values assigned to the WebUserID and WebPassword properties stored in the configuration.properties file. To do that you would follow these steps.

1. Run `<OAS_HOME>\j2ee\<COMPONENT>\applications\<APPLICATION>\PSCipher <WebUserID>` to get the encrypted text for WebUserId value.

   For example,

   c:\>cd OraHome_1\j2ee\PeopleSoft\applications\PeopleSoft
   c:\OraHome_1\j2ee\PeopleSoft\applications\PeopleSoft>PSCipher.bat PTWEBSERVER
   Your environment has been set.
   Encrypted text: {V1.1}jId3vgo6Rejke7gsjI4iss==

   Note. You need to change to the current directory containing the PSCipher utility before submitting text (as shown in the previous example).

   Note. The value between the brackets indicates the version number of the key file used to encrypt the text. In this case, the version is 1.1.

2. Copy the generated encrypted text to the WebUserID property in the configuration.properties file, overwriting any previous value assigned to the property.

   For example,

   WebUserId={V1.1}jId3vgo6Rejke7gsjI4iss==

3. Run `<OAS_HOME>\j2ee\<COMPONENT>\applications\<APPLICATION>\PSCipher <WebPassword>` to get the encrypted text for WebPassword value.

   For example,

   c:\>cd OraHome_1\j2ee\PeopleSoft\applications\PeopleSoft
   c:\OraHome_1\j2ee\PeopleSoft\applications\PeopleSoft>PSCipher.bat PTWSPassword
   Your environment has been set.
   Encrypted text: {V1.1}n2IenrGein6ib8/kNvkDdl==
4. Copy the generated encrypted text to the WebPassword property in the configuration.properties file, overwriting any previous value assigned to the property.

For example,

WebPassword={V1.1}n2IenrGein6ib8/kNvkDdl==

Note. This same procedure will need to be applied whenever you intend to encrypt text using PSCipher. Note that in the following sections of this document it is assumed that you understand how to encrypt the text value.

Generating a Unique Encryption Key

You use the PSCipher Java utility’s buildkey command to build new Triple DES encryption keys. The buildkey command adds a new Triple DES encryption key stored in the psvault file (the key file). If you generate new versions of the key file, the system appends the new version of the key to the end of the key file.

To invoke the command on a Windows server, change to the directory where PSCipher resides and enter:

...\pscipher -buildkey

To invoke the command on UNIX, change to the directory where PSCipher resides and enter:

.../PSCipher.sh -buildkey

Select one web server in your system to generate the new version of the key file. The pscipher.bat and PSCipher.sh utilities only run in the Java environment of the web server. After you have created the new key file, you then copy the new version of psvault from the initial server to the appropriate directories on all the appropriate servers in your system. The psvault file is stored in different directories depending on your web server vendor (as described in the following sections). On the application server the psvault file resides in <PS_HOME>/secvault.

Note. If you are not using the default encryption key and you have generated a unique encryption key, note that each time you add a new server to your system, you will need to copy the key file to the appropriate location on that server. For example, if you are using the default key version ({V1.1}), any server you add to the system and install PeopleTools 8.49 on will also have the default key version ({V1.1}). As such, no further steps are required. However, if you have generated a new key, giving the version number a value of {V1.2} or greater, then you need to make sure to copy that key file to the added server(s). Also, each time you update the key, you need to ensure that the new version of the key file is copied to the additional servers in your system.

Warning! When you upgrade to new PeopleTools releases, as in PeopleTools 8.47 to PeopleTools 8.49, you will need to backup any modifications you have made to the key file using PSCipher in the previous release and reapply that same key file to the appropriate servers onto which you have installed the new PeopleTools release.

Updating the Encryption Key on Oracle Application Server

On the Oracle Application Server PSCipher.bat and the psvault key file are stored in the following location:

<OAS_HOME>/j2ee/<COMPONENT>/applications/<APPLICATION>.
Generating the Encryption Key on Oracle Application Server

To update the encryption key on Oracle Application Server:

1. Run `<OAS_HOME>j2ee<COMPONENT>applications<APPLICATION>PSCipher –buildkey` to create a new key in the key file.
   
   For example,
   
   ```
   C:\>cd OraHome_1\j2ee\PeopleSoft\applications\PeopleSoft
   c:\OraHome_1\j2ee\PeopleSoft\applications\PeopleSoft\PSCipher.bat -buildkey
   Your environment has been set.
   A new key of version {V1.2} is generated successfully
   ```
   
2. Copy `<OAS_HOME>j2ee<COMPONENT>applications<APPLICATION>psvault` to the equivalent location on all other web server hosts and to `<PS_HOME>secvault` on all application servers in your system.

3. Modify the encrypted text fields as described in the following sections.

 Updating the Web Profile

The configuration.properties file is located in the following directory:

```
<OAS_HOME>j2ee<COMPONENT>applications<APPLICATION>PORTAL WEB-INF psftdocs ps
```

The following encrypted text values in the configuration.properties file need to updated:

```
WebUserId={V1.1}et5LM5/C2fQPVWt5cztapg==
WebPassword={V1.1}et5LM5/C2fQPVWt5cztapg==
```

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the WebUserID and WebPassword properties in the configuration.properties file, overwriting any previous value assigned to the property.

 Updating the Integration Gateway

On the Integration Gateway, you need to modify the following files:

- `gatewayUserProfile.xml`
- `integrationGateway.properties`

The `gatewayUserProfile.xml` file is located in the following directory:

```
<OAS_HOME>j2ee<COMPONENT>applications<APPLICATION>PSIGW WEB-INF
```

In the `gatewayUserProfile.xml` file, update the following text value:

```
<password>{V1.1}GD9klUFw8760HVaqeT4pkg==</password>
```

**Note.** There can be more than one password field in this file. There could be different `<password></password>` entries for different users. You should use PSCipher to encrypt all `<password></password>` entries.

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the `<password></password>` entry in the `gatewayUserProfile.xml` file, overwriting any previous value.
The integrationGateway.properties file is located in the following directory:

\OAS_HOME\j2ee\COMPONENT\applications\APPLICATION\PSIGW\WEB-INF

Update the following text values stored in the integrationGateway.properties file.

**Note.** If you are not currently assigning a value to one of the following properties, you don’t need to supply a value.

- ig.isc.password=
- ig.isc.$NODENAME.password=
- #ig.certificatePasswd=
- secureFileKeystorePasswd=
- #ig.jms.JMSTargetConnector.JMSProvider.Password=
- # ig.jms.Queue1.Password=
- # ig.jms.Topic1.Password=
- #ig.jms.Topic1.NodePassword=

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the corresponding entries in the integrationGateway.properties file, overwriting any previous value.

### Updating WSRP/WSS

You need to update the wss.properties file used for Web Services Remote Portal (WSRP) and Web Services Security (WSS).

The wss.properties file needs to be updated in the following locations:

- \OAS_HOME\j2ee\COMPONENT\applications\APPLICATION\PORTAL\WEB-INF\classes
- \OAS_HOME\j2ee\COMPONENT\applications\APPLICATION\pspc\WEB-INF\classes

Update the following text entry in the wss.properties file in both locations:

org.apache.ws.security.crypto.merlin.keystore.password=

Submit each password value to PSCipher, and copy the generated encrypted text to the corresponding entries in the wss.properties file, overwriting any previous value.

### Updating the Encryption Key on IBM WebSphere

On IBM WebSphere, PSCipher.bat and psvault key file are stored in the following location:

\PS_HOME\webserv\Node_Server\APPLICATION.ear

#### Generating the Encryption Key on IBM WebSphere

To update the encryption key:
1. Run `<PS_HOME>\webserv\<Node_Server>\<APPLICATION>.ear` PSCipher –buildkey to create a new key in the key file.
   
   For example,
   
   ```
c:\>cd pshome\webserv\DS9Node_DS9Node_server1\peoplesoft.ear
c:\pshome\webserv\DS9Node_DS9Node_server1\peoplesoft.ear>PSCipher.bat -buildkey
   Your environment has been set.
   A new key of version {V1.2} is generated successfully
   ```

2. Copy `<PS_HOME>\webserv\<Node_Server>\<APPLICATION>.ear\psvault` to the equivalent location on all other web server hosts and to `<PS_HOME>\secvault\psvault` on all application servers in your system.

3. Modify the encrypted text fields as described in the following sections.

**Updating the Web Profile**

The configuration.properties file is located in the following directory:

```
<PS_HOME>\webserv\<Node_Server>\<APPLICATION>.ear\PORTAL\WEB-INF\psftdocs\ps
```

The following encrypted text values in the configuration.properties file need to updated:

- `WebUserId={V1.1}et5LM5/C2fQPVWt5cztapg==`
- `WebPassword={V1.1}et5LM5/C2fQPVWt5cztapg==`

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the WebUserID and WebPassword properties in the configuration.properties file, overwriting any previous value assigned to the property.

**Updating the Integration Gateway**

On the Integration Gateway, you need to modify the following files:

- `gatewayUserProfile.xml`
- `integrationGateway.properties`

The gatewayUserProfile.xml file is located in the following directory:

```
<PS_HOME>\webserv\<Node_Server>\<APPLICATION>.ear\PSIGW\WEB-INF\`
```

In the gatewayUserProfile.xml file, update the following text value:

```
<password>{V1.1}GD9klUFw8760HVaqeT4pkg==</password>
```

Note. There can be more than one password field in this file. There could be different `<password></password>` entries for different users. You should use PSCipher to encrypt all `<password></password>` entries.

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the `<password></password>` entry in the gatewayUserProfile.xml file, overwriting any previous value.

The integrationGateway.properties file is located in the following directory:

```
<PS_HOME>\webserv\<Node_Server>\<APPLICATION>.ear\PSIGW\WEB-INF\`
```
Update the following text values stored in the integrationGateway.properties file.

**Note.** If you are not currently assigning a value to one of the following properties, you don’t need to supply a value.

- `ig.isc.password=`
- `ig.isc.$NODENAME.password=`
- `#ig.certificatePasswd=`
- `secureFileKeystorePasswd=`
- `#ig.jms.JMSTargetConnector.JMSProvider.Password=`
- `# ig.jms.Queue1.Password=`
- `# ig.jms.Topic1.Password=`
- `#ig.jms.Topic1.NodePassword=`

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the corresponding entries in the integrationGateway.properties file, overwriting any previous value.

### Updating WSRP/WSS

You need to update the wss.properties file used for Web Services Remote Portal (WSRP) and Web Services Security (WSS).

The wss.properties file needs to be updated in the following locations:

- `<PS_HOME>`\websrv\<Node_Server>\<APPLICATION>.ear\PORTAL\WEB-INF\classes
- `<PS_HOME>`\websrv\<Node_Server>\<APPLICATION>.ear\pspc\WEB-INF\classes

Update the following text entry in the wss.properties file in both locations:

`org.apache.ws.security.crypto.merlin.keystore.password=`

Submit each password value to PSCipher, and copy the generated encrypted text to the corresponding entries in the wss.properties file, overwriting any previous value.

### Updating the Encryption Key on BEA WebLogic

On BEA WebLogic PSCipher.bat and psvault are stored in the following location:

`<PS_HOME>`\webserv\<DOMAIN>

#### Generating the Encryption Key on BEA WebLogic

To update the encryption key:

1. Run `<PS_HOME>`\webserv\<DOMAIN>\PSCipher –buildkey to create a new key in the key file.

   For example,

   ```
c:\cd PS_HOME\webserv\peoplesoft
   ```
c:\PS_HOME\webserv\peoplesoft>PSCipher.bat -buildkey
Your environment has been set.
A new key of version {V1.2} is generated successfully

2. Copy <PS_HOME>\webserv\<DOMAIN>\psvault to the equivalent location on all other web server hosts and to <PS_HOME>\secvault\psvault on all application servers in your system.
3. Modify the encrypted text fields as described in the following sections.

**Updating the Web Profile**

The configuration.properties file is located in the following directory:

<PS_HOME>\webserv\<DOMAIN>\applications\peoplesoft\PORTAL\WEB-INF\psftdocs

The following encrypted text values in the configuration.properties file need to be updated:

```plaintext
WebUserId={V1.1}et5LM5/C2fQPVWt5cztapg==
WebPassword={V1.1}et5LM5/C2fQPVWt5cztapg==
```

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the WebUserID and WebPassword properties in the configuration.properties file, overwriting any previous value assigned to the property.

**Updating the Integration Gateway**

On the Integration Gateway, you need to modify the following files:

- gatewayUserProfile.xml
- integrationGateway.properties

The gatewayUserProfile.xml file is located in the following directory:

<PS_HOME>\webserv\<DOMAIN>\applications\peoplesoft\PSIGW\WEB-INF\n
In the gatewayUserProfile.xml file, update the following text value:

```plaintext
<password>{V1.1}GD9klUFw8760HVaqeT4pkg==</password>
```

**Note.** There can be more than one password field in this file. There could be different `<password></password>` entries for different users. You should use PSCipher to encrypt all `<password></password>` entries.

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the `<password></password>` entry in the gatewayUserProfile.xml file, overwriting any previous value.

The integrationGateway.properties file is located in the following directory:

<PS_HOME>\webserv\<DOMAIN>\applications\peoplesoft\PSIGW\WEB-INF

Update the following text values stored in the integrationGateway.properties file.

**Note.** If you are not currently assigning a value to one of the following properties, you don’t need to supply a value.
• ig.isc.password=
• ig.isc.$NODENAME.password=
• #ig.certificatePasswd=
• secureFileKeystorePasswd=
• #ig.jms.JMSTargetConnector.JMSProvider.Password=
• # ig.jms.Queue1.Password=
• # ig.jms.Topic1.Password=
• #ig.jms.Topic1.NodePassword=

Submit the values for these properties to PSCipher, and copy the generated encrypted text to the corresponding entries in the integrationGateway.properties file, overwriting any previous value.

**Updating WSRP/WSS**

You need to update the wss.properties file used for Web Services Remote Portal (WSRP) and Web Services Security (WSS).

The wss.properties file needs to be updated in the following locations:

• `<PS_HOME>\webserv\<DOMAIN>\applications\peoplesoft\PORTAL\WEB-INF\classes`
• `<PS_HOME>\webserv\<DOMAIN>\applications\peoplesoft\pspc\WEB-INF\classes`

Update the following text entry in the wss.properties file in both locations:

```
orq.apache.ws.security.crypto.merlin.keystore.password=
```

Submit each password value to PSCipher, and copy the generated encrypted text to the corresponding entries in the wss.properties file, overwriting any previous value.

---

**Securing the External Key File**

The encryption key used by PSCipher is stored in a key file named psvault. This file is critical to your system security. It is very important to protect this file using at least the concepts discussed in this section.

**Setting up Operating System File Security**

The key file should be secured and protected by your operating system with the appropriate file access permissions on all platforms. The recommended file access permissions are:

• File ‘read’ access for only the administrators that need to run the PSCipher command-line utility to encrypt text.
• File ‘read’ access for the only the administrators that need to start the application servers and web servers.
• File ‘write’ access for only the administrators that need to run PSCipher –buildkey to create a new PSCipher key.
Back up the Key File

It will be a time-consuming task to recover your system if you accidentally damage or delete the key file. Therefore, it is important to save a backup of your key file. It is recommended that every time you build a new key that you backup your latest key file to a safe location.

Note. You only need to keep the latest version of your key file for your backup. The latest version contains a version history of previous keys.
CHAPTER 12

Securing Data with Pluggable Cryptography

This chapter provides overviews of data security, pluggable cryptography, and the supported algorithms, and discusses how to:

- Load encryption libraries.
- Define algorithm chains.
- Define algorithm keysets.
- Define encryption profiles.
- Test encryption profiles.
- Invoke encryption profiles from PeopleCode.

Understanding Data Security

To understand pluggable cryptography, it’s first necessary to understand the types of data security that cryptography in general can provide.

Data security comprises the following elements:

- Privacy — keeping data hidden from unauthorized parties.
- Integrity — keeping transmitted data intact.
- Authentication — verifying the identity of an entity that’s transferring data.

Privacy is normally implemented with some type of encryption. Integrity can be accomplished with simple checksums, or better, with more complex cryptographic checksums known as one-way hashes. Many times, this is combined with a type of asymmetric cryptography to produce digital signatures. These signatures, when verified, assure you that the data has not changed. Authentication can also be accomplished using digital signatures, which makes them an obvious choice for data security.

Privacy Through Encryption

Encryption is the scrambling of information such that no one can read it unless they have a piece of data known as a key. Using the key, the sender encrypts plaintext to produce ciphertext. The recipient also uses a key to decrypt the ciphertext, producing the original plaintext. The type of key at either end of this transaction, and the way it’s applied, constitute an encryption algorithm. In all cases, the security of an encryption algorithm should not rely on its secrecy. Rather, it should rely on how well the operations involved affect the input data.

Data encryption algorithms come in two major forms: Symmetric cryptography and asymmetric cryptography. Symmetric cryptography falls into two categories: Block ciphers and stream ciphers. The bulk of cryptographic research has gone into block ciphers, which are employed by PeopleSoft pluggable cryptography.
Symmetric Encryption

Symmetric encryption involves both encrypting and decrypting a piece of data using the same key. To make it a bit harder to crack symmetric encryption schemes, they can be applied in a number of encryption modes. These modes provide ways of applying encryption sequentially to blocks of data, such that each block is encrypted by a combination of the encryption key and the previously encrypted block. Of course, when encrypting the first block, a previously encrypted block isn’t available, so the encryption software applies a random initialization vector (IV) to get the process started. This IV does not have to be secret.

The most popular symmetric encryption modes currently in use are:

- **Electronic Code Book (ECB).**
  ECB does not apply any special recombinations while encrypting. Plaintext blocks are simply encrypted with the key to produce blocks of ciphertext.

- **Cipher Block Chaining (CBC).**
  CBC takes a the previous block of ciphertext and XORs it with the current plaintext block before encrypting the plaintext.

- **Cipher Feed Back (CFB).**
  CFB produces ciphertext by XORing the plaintext with the result of a symmetric encryption operation on the previous ciphertext.

- **Output Feed Back (OFB).**
  OFB produces ciphertext by XORing plaintext blocks with a series of blocks resulting from repeated encryptions of the initialization vector.

There’s a drawback with symmetric cryptography: The recipient of symmetrically encrypted ciphertext must possess the same key to decrypt it that you used to encrypt it. Because of this, you’ll need a secure method of transmitting the key. This can be done a number of ways. You can send the key electronically over a private line that cannot be tapped; you can personally hand the key to your recipient; or you can use a courier to deliver the key. None of these approaches is foolproof or very efficient. A partial solution to this problem is asymmetric encryption.

Asymmetric Encryption

Asymmetric encryption involves the use of a pair of complementary keys, in which one key is used to encrypt a piece of data and the other key is used to decrypt it. This system uses public key encryption technology. The encryption key is called the public key and is widely distributed. The decryption key is the private key, which its owner must never reveal or transmit. Asymmetrically encrypted ciphertext is readable only by the owner of the private key. Anyone who wants to send ciphertext to that party needs only to have a copy of the recipient’s freely available public key to perform the encryption.

Although asymmetric encryption is by design an excellent way for strangers to exchange data, it requires more computing power and capacity than symmetric encryption. Because of this, symmetric and asymmetric encryption are typically used in combination, to take advantage of the strengths of each system.

You apply the more efficient symmetric encryption to your data using a randomly generated symmetric key, which leaves only the problem of transmitting your symmetric key (also known as the content encryption key) to the recipient, who can use it to decrypt the ciphertext. You use the recipient’s public key as a key encryption key, to apply asymmetric encryption to your symmetric key, not to your already encrypted ciphertext. The ciphertext and your symmetric key can now both be transmitted to the recipient. The recipient’s private key is used to decrypt your symmetric key, which in turn is used to efficiently decrypt the ciphertext.

**Integrity Through Hashing**

Integrity can be provided with a *cryptographic hash*. There are several well-known hash types, including MD2, MD4, MD5, SHA1, and RIPEMD160. These hash types have the following properties in common:

- They’re one-way.

  You cannot reverse the operation and get back the text that produced the hash. Indeed, this is obvious since most hashes have values that are 128-256 bits long. The size of a typical message will far exceed this, so it’s extremely unlikely that the hash could contain all of the original information.

- They’re collision resistant.

  There’s almost no possibility of finding two meaningful messages that produce the same hash. Each hash algorithm has a different degree of collision resistance.

To use hashing, you generate a hash value from your data and include it when you transmit the data. The recipient uses the same hash algorithm to generate a hash value from the received data. If the result matches the transmitted hash, the data wasn’t altered in transit.

**Authentication Using Digital Signatures**

Authentication can be accomplished in a number of ways. These include:

- Fixed passwords.
- Time-variant passwords.
- Digital signatures.

Digital signatures are by far the most popular and most reliable method of authentication. Digital signatures usually combine a hash with another cryptographic operation (typically asymmetric encryption) to produce a type of check that not only verifies that the data was not altered in transit, but also assures that the named sender is, in fact, the actual sender of the data.

For example, if we provide a digital signature based on SHA1 with RSA encryption, this means that an SHA1 hash of the message was encrypted with the private key of the sender. Because the SHA1 hash is very collision resistant, and assuming the private key of the sender is known only by the sender, then verifying such a signature indicates that the message was not altered and that it was sent by the named sender.

---

**Understanding Pluggable Cryptography**

*Pluggable cryptography* provides a way for you to secure critical PeopleSoft data and communicate securely with other businesses. It enables you to extend and improve cryptographic support for your data in PeopleTools, giving you strong cryptography with the flexibility to change and grow, by incrementally acquiring stronger and more diverse algorithms for encrypting data. In PeopleTools, pluggable cryptography capability is provided by PeopleSoft pluggable encryption technology (PET).

**Pluggable Cryptography Features**

You can encrypt any data used in your application by invoking PeopleCode to apply your preferred encryption algorithms. You can obtain these algorithms from various vendors’ cryptographic libraries, using the capabilities you want from each library.

The features of pluggable cryptography include:
• Access to a robust set of algorithms (symmetric and asymmetric ciphers, password-based encryption, hashes, MACs, signatures, enveloping, encoding, and writing/processing secured messages).
• The ability to encrypt, decrypt, sign, and verify fields in a database.
• The ability to encrypt, decrypt, sign, and verify external files.
• A secure keystore for encryption keys of widely varying types.
• The ability to convert data from one encryption scheme to another.

Pluggable Cryptography Development

The functional elements of pluggable cryptography are:

• A DLL for each supported encryption library, which uses C glue code to convert each cryptographic library’s API into a unified plug-in with an API accessible from PeopleCode.
• A universal keystore that handles all forms of encryption keys, protected with row-level security.
• A sequence, or chain, of algorithms that you define for a specific type of encryption task. These algorithms are applied in turn to transform data from its original form into a desired final form.
• An encryption profile, which you define as an instance of an algorithm chain, applicable to a specific encryption task.
• The PeopleCode crypt class for accessing the algorithm chains that you define.

To develop and use an encryption profile:

1. Obtain an encryption library.
   The current release of PeopleTools includes the OpenSSL encryption library.
2. Develop API glue code to access the encryption library’s algorithms.
   PeopleTools includes glue code already developed to support the delivered OpenSSL encryption library, as well as glue code to support the PGP encryption library, which you can license from PGP Corporation to enable its functionality.
   The glue code combines with each library to create a plug-in accessible from PeopleCode. The plug-in can be an independent DLL file, or it can be incorporated into the encryption library file, which is the case with the delivered OpenSSL library.
   You can develop glue code to produce plug-in wrappers for other encryption libraries of your choice. The plug-ins make their APIs accessible to PeopleCode, and the new algorithms become as easily available as the delivered algorithms. You can find development information and examples of glue source code in PS_HOME\src\pspetssl and PS_HOME\src\pspetpgp.
3. Load the encryption library’s algorithms into the PET database, generate accompanying encryption keys, and insert them into the PET keystore.
4. Define a chain of algorithms by selecting from the algorithms in the database.
   Because all algorithms are accessed from PeopleCode, you can combine algorithms from different libraries regardless of their source.
5. Define an encryption profile, which is an instance of an algorithm chain applicable to a specific encryption task.
   With an encryption profile you can apply parameter values that differ from the default values.
6. Test the encryption profile using the Test Encryption Profile page.
Chapter 12 Securing Data with Pluggable Cryptography

7. Write PeopleCode to invoke the encryption profile.

With the delivered glue code, you can take advantage of the capabilities of these libraries through a single PeopleCode object. The PeopleCode crypt class provides an interface into all algorithms loaded from the underlying encryption libraries.

Note. This documentation discusses how to use an encryption library for which glue code has already been developed and compiled, such as OpenSSL and PGP.

OpenSSL Library Considerations

The OpenSSL toolkit is delivered with its command line program installed and ready to use. The delivered OpenSSL encryption library supports a subset of the encryption algorithms that are included with the OpenSSL toolkit.

Note. As installed, the OpenSSL toolkit doesn’t support the PKCS7 algorithms from the delivered OpenSSL encryption library. To use those algorithms, you must further configure the OpenSSL toolkit. Refer to the PeopleTools OpenSSL Setup Red Paper, located in PS_HOME\src\OpenSSL.

See Also

http://www.openssl.org/

PGP Library Considerations

If you license the PGP encryption library, you must ensure that its installed location is included in the paths used by both the application server and PeopleSoft Process Scheduler, as follows:

• Using the PSADMIN utility, add the full installed path of the PGP SDK to the Add to PATH parameter.

• In the BEA Tuxedo Settings section of the Process Scheduler configuration file, add the full installed path of the PGP SDK to the Add to PATH parameter.

Note. PGP operations are supported only on platforms where the PGP SDK is supported: Windows, Solaris, and Red Hat Linux.

Understanding the Supported Algorithms

This section discusses the minimum set of encryption algorithms supported by PeopleTools. Support for these algorithms is provided through the OpenSSL and PGP plug-ins, and internally through the PeopleCode crypt class.

Note. You use the crypt class to open an encryption profile, which is comprised of the chain of algorithms that you want to invoke. The crypt class then invokes the algorithms and applies their parameters as specified by the profile.
Some algorithms have accompanying parameters, some with default values, which are stored along with
the algorithms in the PET database. You supply appropriate parameter values in the encryption profile,
and they’re used when the algorithm is invoked.

Each algorithm returns data appropriate to its purpose, using properties provided by the crypt class. The Result
property is used to make output data available from algorithms that produce or transform data by encoding,
decoding, encryption, decryption, generating hash values, or generating signatures. The Verified property
conveys the success or failure of algorithms that verify the input data.

Enterprise PeopleTools 8.49 PeopleBook: PeopleCode API Reference, “Crypt Class”

Internal Algorithms

Support for the following algorithms is provided by the PeopleCode crypt class. They’re automatically
available for inclusion in your algorithm chains.

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSUnicodeToAscii</td>
<td>Convert Unicode text to ASCII.</td>
</tr>
<tr>
<td>PSAsciiToUnicode</td>
<td>Convert ASCII text to Unicode.</td>
</tr>
<tr>
<td>PSHexEncode</td>
<td>Convert octets (bytes) into ASCII hex nibbles.</td>
</tr>
<tr>
<td>PSHexDecode</td>
<td>Convert ASCII hex nibbles (with a leading 0x) into binary octets (bytes).</td>
</tr>
</tbody>
</table>

OpenSSL Algorithms

This section describes the algorithms supported by the OpenSSL plug-in, including encoding algorithms,
hashing algorithms, symmetric encryption algorithms, digital signature algorithms, and the individual secure
messaging algorithms. They’re available when you load the OpenSSL encryption library into the PET database.

Encoding

Following are the supported OpenSSL encoding algorithms.

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base64_encode</td>
<td>Encode data in base64 format.</td>
</tr>
<tr>
<td>base64_decode</td>
<td>Decode data from base64 format.</td>
</tr>
</tbody>
</table>

Hashing

Following are the supported OpenSSL hashing algorithms.

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>md2_generate</td>
<td>Generate an MD2 hash value from the input data.</td>
</tr>
</tbody>
</table>
### Algorithm and Description

<table>
<thead>
<tr>
<th>Algorithm</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>md4_generate</td>
<td>Generate an MD4 hash value.</td>
</tr>
<tr>
<td>md5_generate</td>
<td>Generate an MD5 hash value.</td>
</tr>
<tr>
<td>sha1_generate</td>
<td>Generate an SHA1 hash value.</td>
</tr>
<tr>
<td>ripemd160_generate</td>
<td>Generate a RIPEMD160 hash value.</td>
</tr>
<tr>
<td>hmac_sha1_generate</td>
<td>Generate a hash message authentication code SHA1 hash value.</td>
</tr>
</tbody>
</table>

### Symmetric Encryption

Following are the supported OpenSSL symmetric encryption algorithms, which implement triple Data Encryption Standard (DES) encryption with various key sizes and modes.

<table>
<thead>
<tr>
<th>Algorithm Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3des_ks112_ecb_encrypt</td>
<td>Encrypt data using a key size of 112 bits, in electronic code book mode.</td>
</tr>
<tr>
<td>3des_ks112_ecb_decrypt</td>
<td>Decrypt data using a key size of 112 bits, in electronic code book mode.</td>
</tr>
<tr>
<td>3des_ks112_cbc_encrypt</td>
<td>Encrypt data using a key size of 112 bits, in cipher block chaining mode.</td>
</tr>
<tr>
<td>3des_ks112_cbc_decrypt</td>
<td>Decrypt data using a key size of 112 bits, in cipher block chaining mode.</td>
</tr>
<tr>
<td>3des_ks112_cfb_encrypt</td>
<td>Encrypt data using a key size of 112 bits, in cipher feed back mode.</td>
</tr>
<tr>
<td>3des_ks112_cfb_decrypt</td>
<td>Decrypt data using a key size of 112 bits, in cipher feed back mode.</td>
</tr>
<tr>
<td>3des_ks112_ofb_encrypt</td>
<td>Encrypt data using a key size of 112 bits, in output feed back mode.</td>
</tr>
<tr>
<td>3des_ks112_ofb_decrypt</td>
<td>Decrypt data using a key size of 112 bits, in output feed back mode.</td>
</tr>
<tr>
<td>3des_ks168_ecb_encrypt</td>
<td>Encrypt data using a key size of 168 bits, in electronic code book mode.</td>
</tr>
<tr>
<td>3des_ks168_ecb_decrypt</td>
<td>Decrypt data using a key size of 168 bits, in electronic code book mode.</td>
</tr>
<tr>
<td>3des_ks168_cbc_encrypt</td>
<td>Encrypt data using a key size of 168 bits, in cipher block chaining mode.</td>
</tr>
<tr>
<td>3des_ks168_cbc_decrypt</td>
<td>Decrypt data using a key size of 168 bits, in cipher block chaining mode.</td>
</tr>
<tr>
<td>3des_ks168_cfb_encrypt</td>
<td>Encrypt data using a key size of 168 bits, in cipher feed back mode.</td>
</tr>
<tr>
<td>3des_ks168_cfb_decrypt</td>
<td>Decrypt data using a key size of 168 bits, in cipher feed back mode.</td>
</tr>
<tr>
<td>3des_ks168_ofb_encrypt</td>
<td>Encrypt data using a key size of 168 bits, in output feed back mode.</td>
</tr>
<tr>
<td>3des_ks168_ofb_decrypt</td>
<td>Decrypt data using a key size of 168 bits, in output feed back mode.</td>
</tr>
</tbody>
</table>

Most of these algorithms use the same two parameters:

- **IV (Initialization Vector)**
This parameter isn’t used by the listed ECB mode algorithms. Specify a hex encoded value to use to alter the first plaintext block of data before it’s encrypted. This value serves as an encryption seed value, which must be applied for both encryption and decryption. The value must be the length of the cipher’s blocksize — eight bytes for triple DES. It should be random but its secrecy isn’t critical. For example: 0x0102030405060708

- **SYMMETRIC_KEY**

  Specify as a string the keyset ID of the symmetric encryption key to be used with this algorithm. This parameter must identify a key that’s stored in the PET keyset database.

### Digital Signature Handling

Following are the supported OpenSSL algorithms for generating signatures.

<table>
<thead>
<tr>
<th>Algorithm Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rsa_md5_sign</td>
<td>Generate an RSA signature using an MD5 hash.</td>
</tr>
<tr>
<td>rsa_sha1_sign</td>
<td>Generate an RSA signature using an SHA1 hash.</td>
</tr>
<tr>
<td>dsa_sha1_sign</td>
<td>Generate a DSA signature.</td>
</tr>
</tbody>
</table>

The signing algorithms all use the same parameters:

- **SIGNERPRIVATEKEY**

  Specify, as a string, the keyset ID that represents the signer’s private key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN xxx PRIVATE KEY-----" where xxx is either RSA or DSA, depending on the algorithm.

- **SIGNERPKPASSPHRASE**

  Specify the pass phrase used to decrypt and unlock the signer’s private key. This parameter’s value is the actual pass phrase.

Following are the supported OpenSSL algorithms for verifying signatures.

<table>
<thead>
<tr>
<th>Algorithm Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rsa_md5_verify</td>
<td>Verify an RSA signature based on an MD5 hash.</td>
</tr>
<tr>
<td>rsa_sha1_verify</td>
<td>Verify an RSA signature based on an SHA1 hash.</td>
</tr>
<tr>
<td>dsa_sha1_verify</td>
<td>Verify a DSA-hashed signature.</td>
</tr>
</tbody>
</table>

The verifying algorithms all use the same parameters:

- **SIGNERPUBLICKEY**

  Specify, as a string, the keyset ID that represents the signer’s public key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN xxx PUBLIC KEY ------" where xxx is either RSA or DSA, depending on the algorithm.

- **SIGNATURE**

  Specify, as a string, the hex encoded signature that’s delivered with the input data or that’s returned as the result of invoking a signing algorithm.
Secure Messaging — pkcs7_signed_sign

The pkcs7_signed_sign algorithm generates a signed PKCS7 message. The parameters are:

- **SIGNERCERT**
  Specify, as a string, the keyset ID that represents the signer’s certificate in the PET keyset database. The actual certificate stored in the keyset database is an X.509 certificate. Its value should begin "-----BEGIN CERTIFICATE-----".

- **SIGNERPRIVATEKEY**
  Specify, as a string, the keyset ID that represents the signer’s private key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN xxx PRIVATE KEY-----" where xxx is either RSA or DSA.

- **SIGNERPKPASSPHRASE**
  Specify the pass phrase used to decrypt and unlock the signer’s private key. This parameter’s value is the actual pass phrase.

Secure Messaging — pkcs7_signed_verify

The pkcs7_signed_verify algorithm verifies a signed PKCS7 message. The parameters are:

- **RECIPIENT**
  Specify, as a string, the keyset ID that represents the recipient’s certificate in the PET keyset database. The actual certificate stored in the keyset database is an X.509 certificate. Its value should begin "-----BEGIN CERTIFICATE-----".

- **SYMMETRIC_ALGORITHM**
  Specify the name of the symmetric algorithm used for content encryption. This must be a symmetric encryption algorithm supported by an encryption plug-in.

Secure Messaging — pkcs7_encrypted_encrypt

The pkcs7_encrypted_encrypt algorithm generates an encrypted PKCS7 message.

This algorithm has one parameter: **SIGNERCERT**, which is the keyset ID that represents the signer’s X.509 certificate in the PET keyset database. The value stored in the keyset database should begin with the line "-----BEGIN CERTIFICATE-----".

Secure Messaging — pkcs7_encrypted_decrypt

The pkcs7_encrypted_decrypt algorithm decrypts an encrypted PKCS7 message. The parameters are:

- **RECIPIENTCERT**
  Specify, as a string, the keyset ID that represents the recipient’s certificate in the PET keyset database. The actual certificate in the keyset database should begin with the line "-----BEGIN CERTIFICATE-----".

- **RECIPIENTPRIVATEKEY**
  Specify, as a string, the keyset ID that represents the recipient’s private key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN xxx PRIVATE KEY-----" where xxx is either RSA or DSA.

- **RECIPIENTPKPASSPHRASE**
  Specify the pass phrase used to decrypt and unlock the recipient’s private key. This parameter’s value is the actual pass phrase.
Secure Messaging — pkcs7_signandencrypt_signandencrypt

The pkcs7_signandencrypt_signandencrypt algorithm generates a signed and encrypted PKCS7 message. The parameters are:

- **SIGNERCERT**
  Specify, as a string, the keyset ID that represents the signer’s certificate in the PET keyset database. The actual certificate stored in the keyset database is an X.509 certificate. Its value should begin "-----BEGIN CERTIFICATE-----".

- **SIGNERPRIVATEKEY**
  Specify, as a string, the keyset ID that represents the signer’s private key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN xxx PRIVATE KEY-----" where xxx is either RSA or DSA.

- **SIGNERPKPASSPHRASE**
  Specify the pass phrase used to decrypt and unlock the signer’s private key. This parameter’s value is the actual pass phrase.

- **RECIPIENT**
  Specify, as a string, the keyset ID that represents the recipient’s certificate in the PET keyset database. The actual certificate stored in the keyset database is an X.509 certificate. Its value should begin "-----BEGIN CERTIFICATE-----".

- **SYMMETRIC_ALGORITHM**
  Specify the name of the symmetric algorithm used for content encryption. This must be a symmetric encryption algorithm supported by an encryption plug-in.

Secure Messaging — pkcs7_signandencrypt_decryptandverify

The pkcs7_signandencrypt_decryptandverify algorithm decrypts and verifies an encrypted PKCS7 message. The parameters are:

- **SIGNERCERT**
  Specify, as a string, the keyset ID that represents the signer’s certificate in the PET keyset database. The actual certificate stored in the keyset database is an X.509 certificate. Its value should begin "-----BEGIN CERTIFICATE-----".

- **RECIPIENTCERT**
  Specify, as a string, the keyset ID that represents the recipient’s certificate in the PET keyset database. The actual certificate in the keyset database should begin with the line "-----BEGIN CERTIFICATE-----".

- **RECIPIENTPRIVATEKEY**
  Specify, as a string, the keyset ID that represents the recipient’s private key in the PET keyset database. The actual certificate in the keyset database should begin with the line "-----BEGIN CERTIFICATE-----".

- **RECIPIENTPKPASSPHRASE**
  Specify the pass phrase used to decrypt and unlock the recipient’s private key. This parameter’s value is the actual pass phrase.
PGP Algorithms

This section describes the secure messaging algorithms supported by the delivered PGP glue code. The messaging algorithms are available when you license the PGP encryption library from PGP Corporation, compile the glue code, and load the library into the PET database.

pgp_signed_sign

The pgp_signed_sign algorithm generates a signed PGP message. The parameters are:

- **SIGNERPRIVATEKEY**
  Specify, as a string, the keyset ID that represents the signer’s private key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN PGP PRIVATE KEY BLOCK-----".

- **SIGNERKID**
  Specify, as a string, the PGP key ID for the signer’s key. It’s a hex encoded 32 bit value, for example, 0xAB01D6A5. You can obtain this value from the PGP-based tool that created the key.

- **SIGNERPKPASSPHRASE**
  Specify the pass phrase used to decrypt the signer’s private key. This parameter’s value is the actual pass phrase.

- **CLEARSIGN**
  Specify a numeric value indicating whether the message is to be clearsinged. A clearsinged message should remain readable. If you specify a value of 1, the message remains as is and a radix 64 armored signature block is appended to the message. If you specify a value of 0, the signature block is appended and the entire message is radix 64 armored.

pgp_signed_verify

The pgp_signed_verify algorithm verifies a signed PGP message.

This algorithm has one parameter: **SIGNERPUBLICKEY**, which is the keyset ID that represents the signer’s PGP Public key in the PET keyset database. The value stored in the keyset database should begin with the line "-----BEGIN PGP PUBLIC KEY BLOCK-----".

pgp_encrypted_encrypt

The pgp_encrypted_encrypt algorithm generates an encrypted PGP message. The parameters are:

- **RECIPIENTPUBLICKEY**
  Specify, as a string, the keyset ID that represents the recipient’s public key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN PGP PUBLIC KEY BLOCK-----".

- **RECIPIENTKID**
  Specify, as a string, the PGP key ID for the recipient’s key. It’s a hex encoded 32 bit value, for example 0xAB01D6A5. You can obtain this value from the PGP-based tool that created the key.

pgp_encrypted_decrypt

The pgp_encrypted_decrypt algorithm decrypts an encrypted PGP message. The parameters are:

- **RECIPIENTPRIVATEKEY**
  Specify, as a string, the keyset ID that represents the recipient’s private key in the PET keyset database. The actual value in the keyset database should begin "-----BEGIN PGP PRIVATE KEY BLOCK-----".
Securing Data with Pluggable Cryptography

Chapter 12

• **RECIPIENTPKPASSPHRASE**
  Specify the pass phrase used to decrypt the recipient’s private key. This parameter’s value is the actual pass phrase.

• **RECIPIENTPUBLICKEY**
  Specify, as a string, the keyset ID that represents the recipient’s public key in the PET keyset database. The actual value in the keyset database should begin "-----BEGIN PGP PUBLIC KEY BLOCK-----".

• **RECIPIENTKID**
  Specify, as a string, the PGP key ID for the recipient’s key. It’s a hex encoded 32 bit value, for example 0xAB01D6A5. You can obtain this value from the PGP-based tool that created the key.

**pgp_signedandencrypted_signandencrypt**

The `pgp_signedandencrypted_signandencrypt` algorithm generates a signed and encrypted PGP message. The parameters are:

• **SIGNERPRIVATEKEY**
  Specify, as a string, the keyset ID that represents the signer’s private key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN PGP PRIVATE KEY BLOCK-----".

• **SIGNERKID**
  Specify, as a string, the PGP key ID for the signer’s key. It’s a hex encoded 32 bit value, for example 0xAB01D6A5. You can obtain this value from the PGP-based tool that created the key.

• **SIGNERPKPASSPHRASE**
  Specify the pass phrase used to decrypt the signer’s private key. This parameter’s value is the actual pass phrase.

• **RECIPIENTPUBLICKEY**
  Specify, as a string, the keyset ID that represents the recipient’s public key in the PET keyset database. The actual value in the keyset database should begin "-----BEGIN PGP PUBLIC KEY BLOCK-----".

• **RECIPIENTKID**
  Specify, as a string, the PGP key ID for the recipient’s key. It’s a hex encoded 32 bit value, for example 0xAB01D6A5. You can obtain this value from the PGP-based tool that created the key.

• **CLEARSIGN**
  Specify a numeric value indicating whether the message is to be `clearsigned`. A clearsinged message should remain readable. If you specify a value of 1, the message remains as is and a radix 64 armored signature block is appended to the message. If you specify a value of 0, the signature block is appended and the entire message is radix 64 armored.

**pgp_signedandencrypted_decryptandverify**

The `pgp_signedandencrypted_decryptandverify` algorithm decrypts and verifies a signed and encrypted PGP message. The parameters are as follows:

• **RECIPIENTPRIVATEKEY**
  Specify, as a string, the keyset ID that represents the recipient’s private key in the PET keyset database. The actual value in the keyset database should begin "-----BEGIN PGP PRIVATE KEY BLOCK-----".

• **RECIPIENTPKPASSPHRASE**
Specify the pass phrase used to decrypt the recipient’s private key. This parameter’s value is the actual pass phrase.

- **RECIPIENTPUBLICKEY**
  Specify, as a string, the keyset ID that represents the recipient’s public key in the PET keyset database. The actual value in the keyset database should begin "-----BEGIN PGP PUBLIC KEY BLOCK-----".

- **RECIPIENTKID**
  Specify, as a string, the PGP key ID for the recipient’s key. It’s a hex encoded 32 bit value, for example 0xAB01D6A5. You can obtain this value from the PGP-based tool that created the key.

- **SIGNERPUBLICKEY**
  Specify, as a string, the keyset ID that represents the signer’s public key in the PET keyset database. The actual key value in the keyset database should begin "-----BEGIN PGP PUBLIC KEY BLOCK-----".

- **SIGNERKID**
  Specify, as a string, the PGP key ID for the signer’s key. It’s a hex encoded 32 bit value, for example 0xAB01D6A5. You can obtain this value from the PGP-based tool that created the key.

**Algorithm Chain Considerations**

Although you can select any sequence of algorithms to define a chain, many possible sequences don’t work because the cumulative effect of the algorithms doesn’t make any sense. You must define sequences of compatible algorithms.

To apply any of the supported algorithms for symmetric encryption, hashing, encoding, or secure messaging, the input data must be in ASCII text format. Because PeopleSoft stores data in Unicode format, the first algorithm in most chains must be PSUnicodeToAscii, and the last algorithm must be PSAsciiToUnicode.

**Loading Encryption Libraries**

## Load Encryption Libraries

**Library ID:** PSPETSSL  
**Library File:** pspetssl.dll

### Loaded Algorithms

**Algorithm ID:** 3des_ks112_cbc_decrypt  
**Parameter Name:** IV  
**Parameter Value:**  
**Parameter Name:** SYMMETRICKEY  
**Parameter Value:**

---

### Library File

Enter the filename of the selected encryption library for your operating system platform. The names of the delivered OpenSSL and PGP library files depend on the operating system platform where your application is installed.

Following are the encryption library filenames for each supported platform:

- **Microsoft Windows**  
  - OpenSSL: pspetssl.dll  
  - PGP: pspetpgp.dll

- **Red Hat Linux**  
  - OpenSSL: libpspetssl.so  
  - PGP: libpspetpgp.so

- **Sun Solaris**  
  - OpenSSL: libpspetssl.so  
  - PGP: libpspetpgp.so

- **HP Tru64 Unix**
Chapter 12 Securing Data with Pluggable Cryptography

OpenSSL: libpspetssl.so
- HP-UX
  OpenSSL: libpspetssl.sl
- IBM AIX
  OpenSSL: libpspetssl.a

Load Library
Click to load the specified encryption library.
Each algorithm provided by the library appears in its own row with its algorithm ID. Its parameters each appear in a row, displaying the parameter’s name and its default value.
If the From Keyset check box is selected, the parameter represents an encryption key. The pluggable cryptography facility uses the parameter’s value to access the encryption key from the PET keystore.

Important! If the library you specified fails to load, you must sign out of your application, then shut down and restart the application server before signing back in.

Defining Algorithm Chains
Select PeopleTools, Security, Encryption, Algorithm Chain to access the Algorithm Chain page.

Algorithm Chain
Algorithm Chain ID: 3DES Decrypt

<table>
<thead>
<tr>
<th>Algorithm Chain ID</th>
<th>Sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>PSUnicodeToAscii</td>
<td>1</td>
</tr>
<tr>
<td>base64_decode</td>
<td>2</td>
</tr>
<tr>
<td>3des_kdf12_cbc_decrypt</td>
<td>3</td>
</tr>
<tr>
<td>PSAsciiToUnicode</td>
<td>4</td>
</tr>
</tbody>
</table>

Algorithm Chain page
Although you can select any sequence of algorithms to define a chain, many possible sequences don’t work because the cumulative effect of the algorithms doesn’t make any sense. You must define sequences of compatible algorithms.
To apply any of the supported algorithms for symmetric encryption, hashing, encoding, or secure messaging, the input data must be in ASCII text format. Because PeopleSoft stores data in Unicode format, the first algorithm in most chains must be PSUnicodeToAscii, and the last algorithm must be PSAsciiToUnicode.

To define an algorithm chain:

1. Open an existing algorithm chain or create a new one.
2. Select the algorithm IDs of the algorithms you want to use in your chain.
   Add a new row for each algorithm. The available algorithms depend on the encryption libraries you previously loaded. You can select the algorithms in any order.
3. Specify the operation sequence for your algorithm chain.
   Enter a number in the Sequence box for each algorithm. The lowest number designates the first algorithm, and the highest number designates the last. When you save the chain, the rows are resorted according to their sequence numbers.
4. Save your algorithm chain definition.

### Delivered Algorithm Chains

PeopleSoft delivers pluggable cryptography with the following predefined algorithm chains:

<table>
<thead>
<tr>
<th>Algorithm Chain</th>
<th>Algorithms</th>

### Defining Algorithm Keysets

Select PeopleTools, Security, Encryption, Algorithm Keyset to access the Algorithm Keyset page.
Algorithm Keyset

Specify an algorithm ID or description to view the keyset of any algorithm in the PET database. Each row displays a key value. You can add, modify, or remove key values.

**Keyset ID**

Enter a name for the key value in the current row. Each row must have a unique keyset ID for this algorithm.

**Use Certificate Store Value**

This option enables you to take advantage of key values already stored in the PeopleSoft keystore. Select a certificate alias from the keystore, then indicate whether the alias represents a certificate (for encryption) or a private key (for signing).

*Warning!* Certificates in the PeopleSoft keystore are in standard X.509 format, which is compatible for use with the internal and OpenSSL algorithms, but is not compatible with the PGP encryption library. If you’re defining the keyset for a PGP algorithm, you must select the Use Entered Value radio button.

**Use Entered Value**

Select this option to use key values that aren’t in the PeopleSoft keystore. Enter a key value that’s formatted appropriately for the algorithm that you’re configuring. This value will be entered into the PET keyset table, not the PeopleSoft keystore.

The value that you enter has a length that depends on the keysize of the cipher. For triple DES with keysize 112, this is 16 bytes. For a keysize of 168, this is 24 bytes. This value should be represented in hex notation.
You must generate the key value that you enter here. You can use any key generation utility capable of producing hex encoded keys of the required length. PeopleSoft delivers the core OpenSSL command line program precompiled and ready to use. You can use it to generate key values and perform other encryption-related tasks. The executable program is `PS_HOME\bin\server\WINX86\openssl.exe` on Windows, and `PS_HOME/bin/openssl` on Unix and Linux platforms.

**Note.** The key value that you enter here is stored in the PET keyset table using a combination of the algorithm ID and the keyset ID as its identifier. Because this combination is unique for each algorithm, you can create identically defined keyset rows for multiple algorithms.

**See Also**

Chapter 12, “Securing Data with Pluggable Cryptography.” OpenSSL Library Considerations, page 187

http://www.openssl.org/

---

**Defining Encryption Profiles**

Select PeopleTools, Security, Encryption, Encryption Profile to access the Encryption Profile page.
To define a new encryption profile, specify a new profile ID, then select an algorithm chain ID. Each algorithm in the chain appears in order, in its own row with its algorithm ID and chain sequence number. Its parameters each appear in a row, displaying the parameter’s name and default value, and indicating whether the parameter represents a key. You can override a parameter’s default value by editing it in the Parameter Value edit box.

**Deleting an Encryption Profile**

To delete an encryption profile, select PeopleTools, Security, Encryption, Delete Encryption Profile. Select the profile you want to delete, and click Delete on the Delete Encryption Profile page.

**Testing Encryption Profiles**

Select PeopleTools, Security, Encryption, Test Encryption Profile to access the Encryption Demo page.
Encryption Demo

**Encryption Profile ID:**

```plaintext
TRIPLE DES ENC B64
```

**Text to be Encrypted:**

```plaintext
Hello, world.
```

**Encrypted Text:**

```
cA5YK29yV5X+WqxA/Tbsog==
```

Use this page to test encryption profiles, ensuring that your encryption profiles produce the expected results.

To test an encryption profile:

1. Select the profile’s encryption profile ID.
2. In the Text to be Encrypted field, enter or paste the input text.
3. Click Run Encryption Profile.

The resulting output text appears in the Encrypted Text field.

You can use this page to test decryption as well. You can also test complementary pairs of profiles — one to encrypt, and the other to decrypt. By copying the result of the encryption profile test and pasting it as input to the decryption profile test, you can determine whether the text you get out is the same as the text you put in.

---

**Invoking Encryption Profiles from PeopleCode**

You access the encryption profile using the PeopleCode crypt class.

Following is an example of PET PeopleCode:

```plaintext
&cry = CreateObject("Crypt");
&bar = QE_CRYPT_WRK.CRYPT_PRFL_ID;
&cry.Open(&bar);
&cry.UpdateData(QE_CRYPT_WRK.DESCRLONG);
QE_CRYPT_WRK.LARGECHAR = &cry.Result;
```

CHAPTER 13

Implementing Query Security

This chapter discusses how to:

• Define query profiles.
• Build query access group trees.
• Work with query trees.
• Define row-level security and query security records.

Note. You perform these setup tasks using the Query Access Manager, Application Designer, and permission lists. After you define Query Access Group trees, you provide user access using the Query tab in Permission Lists.

Defining Query Profiles

Query takes advantage of user’s security settings, row-level security, and primary permission list. Query is a PeopleTool that helps you build SQL queries to retrieve information from your application tables. For each Query user, you can specify the records they are allowed to access when building and running queries.

You do this by creating Query Access Groups in the Query Access Group Manager, and then you assign users to those groups with Query permissions. Keep in mind that Query permissions are enforced only when using Query; it doesn’t control run-time page access to table data.

Building Query Access Group Trees

Trees are a graphical way of presenting hierarchical information. PeopleSoft Query uses query access group trees to control the access of the tables in the PeopleSoft database. You define a hierarchy of PeopleSoft record definitions, based on logical or functional groupings, and then give users access to one or more nodes of the tree. Users can retrieve information only from those tables whose record definitions to which they have access.

You create and update query access group trees using Query Access Manager. To get you started, we’ve included some sample query access group trees with the PeopleSoft applications. Which trees you have depend on which PeopleSoft applications you’ve installed. Each tree contains access groups and record definitions categorized by function.

Access groups mark and define a functional group of records or other access groups—in other words, they are descriptive placeholders used to categorize actual record definitions in a logical, hierarchical format. When you define users’ security rights to a tree, you specify which access groups they are permitted to query.

This section explains how to create query access group trees. It assumes that you’re familiar with the concept and terminology of PeopleSoft trees.
Query Access Group Tree Considerations

You should create query access group trees based on your organization’s needs and on any customizations you’ve made. Remember that the sample trees we provide may be replaced when you upgrade to a subsequent PeopleSoft release, so if you modify the samples rather than create your own trees, you may lose your customizations.

Every record definition that you want users to be able to query must be in a query tree. However, they don’t all have to be in the same query tree. One strategy is to use the sample query trees to provide access to the standard PeopleSoft record definitions, but create separate query trees for record definitions that you add in the course of customizing the system. This way, you take advantage of the sample trees but avoid overwriting your changes during future upgrades.

How you organize the contents of the query tree depends on the needs of your organization and your users. For example, you might want to create small trees that are not intimidating to non-technical or casual users. The sample query trees provided in the PeopleSoft application are divided by functions, but to simplify the trees, you may want to create separate trees that contain subcategories of each function. For example, you could create separate trees for U.S. and Canadian record components to grant users in each region security access to only the record components they should use.

Note. You should consider adding record definitions to the query trees in a hierarchy that matches the parent/child relationship of records in your database. Though you don’t have to organize records this way—Application Designer actually controls the parent/child hierarchy in your database—you’ll probably find it helpful to keep the query trees consistent with your database structure.

Working with Query Trees

This section provides an overview of Query access group trees and discusses how to:

• Open Query access group trees.
• Define the Query tree.
• View and modify definitions.

Understanding Query Access Group Trees

If you have worked with Tree Manager and/or trees before, you should take a moment to review the following information describing the differences between typical trees and the Query access group trees.

Nodes

Regarding nodes, consider the following:

• Query access group trees contain two types of Nodes: groups and records.
• Groups are a logical representation of a set of child groups or records, similar to folders in Microsoft Windows.
• Records represent a PeopleSoft record definition.

Structure

Regarding structure, consider the following:

• Always use the ACCESS_GROUP Tree Structure.
• Do not use SetID or UKV/BU.
• Do not have Details.
• Do not use Levels.
• Do not use Branches.

Requirements
Regarding requirements, consider the following:
• The Root Node is always a group.
• Groups must be unique in a given Tree while records definitions can be repeated.
• Groups and records could have Child Groups and Child Records.
• Each record needs a unique fully qualified path in the tree.
  You can’t add the same record under the same parent node (group or record).

Opening Query Access Group Trees
Before you can view and modify a Query access group tree definition, you need to locate the correct tree definition.

To open a Query tree definition:
2. On the Basic Search page select your search criteria.
   You can search by Tree Name, Tree Category, Tree Description, Group Name used in a Tree, or Record Name used in a Tree.
3. Click Search.
   After clicking Search, a list appears containing the definitions that meet your criteria.
4. Double-click the appropriate definition.
   The list of trees in the lower part of the page also serves as a maintenance utility enabling you to Delete or Copy a tree. If you click Delete, the system prompts you to confirm the action, and if you click Copy, the system displays the Copy Tree page where you can select a name for the copied tree.
   Some of the trees in the grid may appear without Copy/Delete buttons visible. This occurs when Object Security settings are such that you only have read-only access to these trees.

Defining the Query Tree
Before you can insert nodes for access groups and record components, you must first define a number of important characteristics for the tree.

Access the Tree Definition and Properties page by selecting Create a New Tree on the Basic Search Page.
For the tree name, we recommend that you start the name with QRY_ so that you can easily identify the tree as a custom query tree. The standard query trees we deliver with the system start with QUERY_.

The Structure ID is read only and always reads ACCESS_GROUPS for Query access trees.

The description appears with the name and effective date in the list box when you select from a list of trees.

The status default is set to Active. Query trees are available immediately if the effective date is active; you don’t need to run an SQR utility like you do for organizational security trees.

If necessary add a category, which are groupings of the definitions.

Item Counts shows the number of nodes within the access group.

Once you’ve completed the tree definition, click OK. On the Enter Root Node for Tree page, select an existing Access Group using the Lookup Access Group control, or create a new one.

### Viewing and Modifying Definitions

This section describes the controls you use to modify Query Access Group Trees after you have opened one from the search page.
Chapter 13 Implementing Query Security

Query Access Manager

Effective Date: 01/01/1900 Status: Active Valid Tree

   | OPTIMIZATION - Optimization
   | PORTAL - Portal
   | PSPRSMIPERM - Portal Structure Permission
   | PSPRSMATTRVAL - Portal Attr Value Tbl
   | PSPRSMATTR - Portal Attribute Table
   | PSPRDMCNTPRV - Portal Content Provider Tbl
   | PSPRSMDEFN - Portal Structure Defn Tbl
   | PSPRDMDEFN - Portal Definition Table
   | BUSINESS_INTERLINK - Business Interlinks
   | GLOBAL_TIME - Time Definitions
   | CONTENT_DEFINITION - CONTENT_DEFINITION

Effective Date
Shows the current effective date.

Status
Shows either Active or Inactive.

Tree Name
Shows the name of the current tree.

Save, Save As
These are the two save options. Each option appears only if it relates to the current activity. Save enables you to save your changes to the database. Save As enables you to clone tree definitions at save time.

Close
Closes the definition and returns you to the search page.

Tree Definition
Shows the Tree Definition and Properties page that you modified when you created the definition.

Display Options
Shows the Configure User Options page where you can adjust the presentation of the trees. For example, you can choose whether the Node ID appears and how many lines of the definition appear at a time. Most of these don’t apply for Query Access Trees so they’re disabled.

Print Format
Displays a print preview of the tree definition.
Once you have drilled down into a definition, a “bread crumb” view appears just above the Collapse/Expand All controls to provide orientation, especially within large trees.

Collapses all nodes of the tree into their parent groups so that you see only the root node and the first layer of child groups.

Expands all nodes of the tree so that each child object is visible.

If you are looking for a specific access group or a record you can use the Find Value page rather than drilling down into the tree. You specify an access group or a record or its description. You can select a case sensitive search and specify that an exact match must be found.

You can use pattern search option by deselecting the Exact Matching check box. This performs platform independent search for the Record/Group starting from the specified pattern.

If you want to perform pattern search not starting from the beginning of Record/Group name, specify a platform dependent wildcard character at the beginning of the pattern.

For example, to find all occurrences of ‘TBL’ in the Records, you specify %TBL as a search condition (for Microsoft SQL Server database).

If you specify both Group and Record search conditions the search is performed on Group condition. If you specify both Group/Record ID (name) and Description conditions the search is performed on ID/name condition.

Note. Always make sure that any modifications to the tree are saved prior to using the Find feature.

When you have a node or record selected, the actions you perform are controlled by the icons that appear to the left and right of the definition. The descriptions of the actions are below. You can pass the mouse pointer over an icon to reveal its label.

When a node folder is open, click the Collapse Node icon to collapse the node.

When a node folder is closed, click the Expand Node icon to expand the node.

The Insert Sibling Group icon inserts an access group node at the same level as the currently selected node.

The Insert Child Group icon inserts an access group node at the next level lower than the currently selected node.

The Insert Child Record icon inserts a record definition within an access group node.

For access groups, click the Edit Data icon to edit the Description and the Definition (long description) on the Access Group Table.

Click the Delete icon to delete both access groups and records. You can’t delete the root node.
You can cut and paste access groups and records to move them within the tree. Once you click the Cut icon, the Paste as Child icon becomes enabled. You can’t cut the root node.

**Note.** After you perform the cut function, only navigation and search features are available until you execute the paste function. This protects the node in the clipboard.

---

### Defining Row-Level Security and Query Security Records

By default, when you give Query users access to a record definition, they have access to all the rows of data in the table built using the associated record definition. In some cases, though, you want to restrict users from seeing some of those data rows. For example, you might not want your human resources staff to have access to compensation data for vice presidents or above. In other words, you want to enforce *row-level security*, which is offered by many PeopleSoft applications.

This section describes the relationship between row-level security and Query security record definitions.

#### Row-Level Security

With row-level security, users can have access to a table without having access to all rows on that table. This type of security is typically applied to tables that hold sensitive data. For example, you might want users to be able to review personal data for employees in their own department, but not for people in other departments. You would give everyone access to the PERSONAL_DATA table, but would enforce row-level security so that they could only see rows where the DEPTID matches their own.

PeopleSoft applications implement row-level security by using a SQL view that joins the data table with an authorization table. When a user searches for data in the data table, the system performs a related record join between the view and the base table rather than searching the table directly. The view adds a security check to the search, based on the criteria you’ve set up for row-level security. For example, to restrict users to seeing data from their own department, the view would select from the underlying table just those rows where the DEPTID matches the user’s DEPTID.

#### Query Security Record Definitions

You implement row-level security by having Query search for data using a query security record definition. The query security record definition adds a security check to the search.

Query security record definitions serve the same purpose as search record definitions do for panels. Just as a panel’s search record definition determines what data the user can display in the panel, the query security record definition determines what data the user can display with Query.

To get Query to retrieve data by joining a security record definition to the base table, you specify the appropriate Query Security Record when you create the base table’s record definition.

To apply row level security:

1. Select PeopleTools, Application Designer to open the Application Designer, and open the record on which you want to apply row-level security.
2. With the record definition open in the Application Designer, click the Properties button, and select the Use tab from the Record Properties dialog box.

**Note.** You use this dialog box to set a number of different aspects of the record definition. The only item related to Query security is Query Security Record list box.
3. Select the security record definition (usually a view) in the Query Security Record list box.

Each PeopleSoft product line comes with a set of views for implementing its standard row-level security options. See the product documentation for details.

**Note.** The Parent Record list box is also relevant to Query. It identifies a record definition that is the current definition's parent, meaning that it holds related data and that its keys are a subset of the current record definition’s keys. If you designate a parent record, Query automatically knows what fields to use when you join these two tables for a query.

Typically, the Query Security Record definition you’ll want to select is the same one you use as the search record definition for the panel that manages this table. If you’re enforcing one of the standard row-level security options from a PeopleSoft application, select the PeopleSoft-supplied security view for that option. See the application documentation for a list of the available views. If you’ve designed your own security scheme, select a record definition that appropriately restricts the rows a query will return.

4. Once you’ve set the query security record definition, click OK to close the Record Properties dialog box, then save the record definition.

If you’ve already used SQL Create to build a table from this record definition, you don’t need to rebuild it.

**Note.** PeopleSoft row-level security views restrict users from seeing certain rows of data. To secure data through the search record, simply put one of the three Row Level Security fields on the record as a Key, not a List Box Item. The three Row Level Security fields are OPRID (User ID), OPRCLASS (Primary Permission List), and ROWSECCLASS (Row Security Permission List). If one of these fields is on the search record as a Key, not a List Box Item, PeopleTools does the following. PeopleTools adds a WHERE clause when it performing a SELECT through the record forcing the value to be equal to the current user’s value.
CHAPTER 14

Implementing Definition Security

This chapter provides an overview of definition security and discusses how to:

• Work with definition groups.
• View definition groups.
• Add and remove definitions.
• Assign definition groups to permission lists.
• Enable display only mode.
• View definition access by user and permission list.

Understanding Definition Security

This section discusses:

• Definition security.
• Definition groups and permission lists.
• Definition security rules.

Definition Security

You can restrict developer access to the record definitions, menu definitions, page definitions, and others that make up your applications. Just as you use Security to control who can access the PeopleSoft pages in your system, you use Definition Security to control who can access and update PeopleTools definitions.

There are two tasks involved with definition security:

• Creating definition groups.
• Linking definition groups to predefined permission lists.

Definition security leverages the permission lists created in PeopleTools Security to restrict access to individual PeopleTools database definitions created using a PeopleTools designer utility, such as PeopleSoft Application Designer or PeopleSoft Tree Manager. Definition types include all of the definitions that appear in the following table. Most definition types are created in PeopleSoft Application Designer.
<table>
<thead>
<tr>

<tr>
<td>Tree Structures</td>
<td>PeopleSoft Tree Manager</td>
</tr>
<tr>
<td>Trees</td>
<td>PeopleSoft Tree Manager</td>
</tr>
<tr>
<td>Translate Tables</td>
<td>PeopleSoft Application Designer</td>
</tr>
</tbody>
</table>

**Note.** You can restrict access to an entire definition type, such as records or pages, using the PeopleTools page in Security. This works by controlling access to the PeopleSoft Application Designer functionality that works with a particular definition type. For example, if you don’t want developers to use application engine programs, don’t allow them to access PeopleSoft Application Engine.

Definition Security settings also works at the field level. To change a field on a record, you must be authorized to update all record definitions that contain the field. For example, to update or rename the EMPLID field on any record definition, you must have access to every record definition that contains the EMPLID field. If you are denied access to the ABSENCE_HIST record definition, which contains EMPLID, you won’t be able to modify any field attributes of EMPLID on any other record that contains the field. This ensures the integrity of your system. In a fast-paced development environment, if PeopleTools definitions are not well secured, problems may result.

Before you start using Definition Security, it’s a good idea to define the definition security needs of your users. Consider these types of questions:

- Should all developers have access to all PeopleTools definitions?
- Should payroll developers have access only to payroll definitions?
- Who will be allowed to access PeopleSoft Application Designer?

### Definition Groups and Permission Lists

Use Definition Security to define definition groups and link them to permission lists that you created in Security.

A definition group is a collection of one or more definitions that form a logical group for security purposes. For example, you’ve created a permission list for analysts who support the PeopleSoft Payroll module, and you call it PAYROLL_DEV. The analysts are allowed to update only payroll definitions. Using Definition Security, you create a definition group containing only payroll definitions, and give it a name, such as PAYROLL_OBJ. Finally, you link PAYROLL_OBJ to PAYROLL_DEV.

You can assign multiple definition groups to a single permission list.
You can’t declare directly that a particular permission list can modify a specific definition type. You do so indirectly by creating a definition group that consists solely of the desired definition type. Also, remember that you can assign a definition to multiple groups as needed. To ensure total definition security, assign every definition to at least one definition group.

**Note.** PeopleTools databases are delivered with a predefined definition group called PEOPLETOOLS that contains all the PeopleTools definitions. Until you create definition groups of your own, the PEOPLETOOLS definitions are the only definitions that you can secure.

### Definition Security Rules

To set up Definition Security properly, it’s helpful to understand how the system interprets definition security settings. The system applies the following rules to determine whether a user is authorized to update a definition:

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Is the definition type assigned to any definition group? If not, then anyone has update access to it. For this reason, you should add all definition types to at least one definition group.</td>
</tr>
<tr>
<td>2</td>
<td>Is the definition type a part of a definition group assigned to the user’s permission lists? If not, the system denies access and displays a message, such as “definition_name is not a definition that you are authorized to access.”</td>
</tr>
<tr>
<td>3</td>
<td>Do all the definition groups of which the definition type is a member have the display-only option enabled? If so, then the system displays the message “definition_name is not a definition that you are authorized to update.” The definition type appears with the Save command disabled.</td>
</tr>
</tbody>
</table>

If the definition passes these system checks, the user is allowed to access and update it—unless it’s a PeopleSoft Application Designer definition, in which case several other security checks are performed first. PeopleSoft Application Designer definitions are also controlled by the PeopleTools in permission lists.

**Important!** A user gets definition security permissions through the primary permission list, not through roles.

### Working With Definition Groups

PeopleSoft Definition Security is a Microsoft Windows-based application that you can access from PeopleSoft Application Designer. Access the PeopleSoft Definition Security window by selecting Go, Definition Security.
To open an existing definition group:

1. Select File, Open, Group.
   
   The Definition Security Open dialog box appears.

2. Select a group ID.

3. Click OK.

To create a new definition group:

2. Add definitions to the group.

3. Save the group and give it a name in the Save Group As dialog box.

To clone a definition group:

1. Open the definition group you want to clone.

2. Select File, Save As.

   The Save Group As dialog appears.

3. Enter a group ID and click OK.

To rename a definition group:

</tbody>
</table>

PS Definition Security displaying all definitions
1. Select File, Rename.
   The Rename Group ID dialog box appears.
2. From the Rename list, select the group that you want to rename.
3. Enter a new group ID in the To edit box.
4. Click OK.

To delete a definition group:
1. Select File, Delete.
   The Definition Security Delete dialog box appears.
2. Select the group ID for the group you want to delete.
3. Click OK.
   A confirmation prompt appears.

---

Viewing Definition Groups

This section discusses how to:

- Select a view.
- View all definitions.
- View definitions of a specific type.

Selecting a View

You can select how you view a definition group by using the View menu, or by selecting an item from the drop-down list box that appears at the top of the application window when you have a definition group open.

Viewing All Definitions

To see the entire definition group, select View, All Definitions.

You see every definition, regardless of type, assigned to the definition group. There are two columns: Type and Name.

- Type identifies the definition type, as in page, query, and so on.
- Name refers to the name given to the definition when it was created.

Viewing Definitions of a Specific Type

To view definitions of a particular type that belong to a definition group, select View, Pages.

The view window is split vertically into two list boxes. The box on the left contains a list of definitions that belong to the definition group and are of the selected type.
The list box on the right is the Excluded *definition_type* list. The label for the definition type changes according to the definition type you are viewing. For example, when you view pages, the label is Excluded Pages, and when you view menus, the label reads Excluded Menus, and so on. The Excluded *definition_type* list box displays the names of all the definitions of the selected type that are not included in the current definition group.

---

**Adding and Removing Definitions**

This section discusses how to:

- Add and remove definitions.
- Remove definitions from a definition group.

**Adding and Removing Definitions**

To add definition types to a definition group, you need to view by the type of definition that you want to add. To add pages to a definition group, select View, Pages.

To add definitions to a definition group:

1. Open the definition group.
2. Select the definition type to view by.
   - Use the View menu or the drop-down list box at the top of the application window.
3. Select the definitions to be added.
   - In the Excluded *definition_type* list box, select the definitions to add to the active definition group.
   - To select multiple definitions, use CTRL or SHIFT keys as you click.
4. Click a left-arrow button to move the definitions into the group.
   - To move just the selected definitions, use the single left arrow. To move all excluded definitions into the group, use the double left arrow.

**Removing Definitions From a Definition Group**

To remove definitions from a definition group:

1. Open the definition group.
2. Select the definition type to view by.
   - Use the View menu or the drop-down list box at the top of the application window.
3. Select the definitions to be removed in the list box on the left.
   - To select multiple definitions, press CTRL key while you click.
4. Click one of the right-arrow buttons to move the definitions out of the group.
   - To move just the selected definitions, use the single right arrow. To remove all definitions from the group, use the double right arrow.
Assigning Definition Groups to Permission Lists

To link a definition group to a permission list, the permission list must already exist.

To link definition groups to a permission list:

1. Select File, Open, Permission List.
   The Definition Security Open dialog box appears.
2. Select a permission list and click OK
   The window displays two list boxes, similar to what you see when adding or removing definitions.
   The list box on the right shows the existing definition groups that are not currently linked to the active
   permission list. The list box on the left shows the group IDs that the permission list is currently
   authorized to access. The group ID is the name that you specified when saving a definition group.
3. Specify the included and excluded groups.
   To enable access to a definition group, select it in the Excluded Group ID list box on the right and
   move it into the list box on the left. To restrict access to a group, select it on the left and move it into
   the Excluded Group ID list box on the right. To move just the selected groups, use the single arrows.
   To move all groups, use the double arrows
   The All Definitions group includes all system definitions. Use it to grant unrestricted access to all
   databases.
4. Select File, Save to save your changes

Enabling Display Only Mode

Enabling display-only access to a definition group means the definitions in that group can be viewed but not
modified. You need to link the definition group to the permission list before you specify a display-only value.

For the All Definitions group, display-only mode applies only to the definition groups in the Excluded Group
ID list.

The following example shows a permission list (INVPANLS) with access to all definitions, or All Definitions
status. Notice that display only is activated. However, it only applies to those groups in the Excluded Group
ID list: the NEWGROUP, ONEMENU, and PEOPLETOOLS groups. This means that the INVPANLS
permission list has read and write access to all definitions in the system except for those that appear in the
Excluded Group ID list. For those definitions, INVPANLS only has read access.

To enable or disable display-only access:

1. Select Change, Display Only.
   The Definition Security List dialog box appears.
   This dialog box lists all the definition groups assigned to the current permission list.
2. Select the groups in the list that you want to make display-only.
   You can use the All button to select all the groups in the list.
3. Click OK.
Viewing Definition Access by User and Permission List

To view a report showing what definitions a user or a permission list can access, use the User Profiles - User ID Queries and Permission Lists - Permission List Queries page, respectively.

On the User Profiles - User ID Queries page, click the User ID’s Application Designer Object Access link.

On the Permission Lists - Permission List Queries page, click the Permission List’s Application Designer Object Access link.

CHAPTER 15

Managing PeopleSoft Personalizations

This chapter provides an overview of personalizations and discusses how to:

• Work with personalization options.
• Define personalization options.
• Work with category groups.
• Work with categories.
• Work with locale-based personalizations
• Add personalizations to permission lists.
• Create custom personalization options.
• Work with the My Personalizations interface.

Understanding Personalizations

PeopleSoft software offers a variety of options that enable end users, especially power users, to complete business transactions in a more efficient manner. These options improve a user’s navigation speed through the system and enable users to select international preferences, such as date and time formats. You select, customize, and define personalizations using the Personalization pages.

To access the Personalization pages, select PeopleTools, Personalization.

Personalizations are grouped in three levels of categories to aid in development, organization, and deployment:

• The first level is the Option Category level.
  This level divides personalizations between functional area, such as PeopleTools personalizations and HCM personalizations. Also, there is a category for custom personalizations, which are those personalizations you develop and deploy in addition to the delivered personalizations.
• The second level is the Category Groups, which represent individual products within a Category Level.
  For example, within the PeopleTools Category Level some Category Groups are Application Designer, Process Scheduler, Security, and so on. Or, within the HCM Category Level one Category Group could be Payroll.
• The third level is the Personalization Categories themselves.
  This is the level that the end user sees. A category represents a product feature, such as navigation or system messages. A category contains a set of related personalizations.
After you have selected the personalizations for your site, you assign them to a user or role, using the Personalizations page of the permission lists component in PeopleTools Security. The Personalizations page enables the security administrator to assign role-based personalizations and enable user control for selected personalization options, if needed.

End users can view and modify their available personalization options from the My Personalization component (USER_SELF_PERSONAL).

The following sections provide more details on defining, customizing, and deploying PeopleSoft personalizations.

---

### Working with Personalization Options

Before you begin defining and deploying personalization options, you need to be familiar with the personalization option categories delivered with PeopleSoft software, and the pages used to view and modify them. This section discusses:

- Navigation personalizations.
- Regional settings.
- General options.
- System messages.
- Internally controlled options.
- Pages used to define and modify personalizations.

Note. PeopleSoft Mobile applications use the standard personalizations.

### Understanding Navigation Personalizations

The following table presents the delivered navigation personalization options.

Note. PTPT1000 is a delivered permission list that you can use as a starting point for a user permission list. The column shows whether PTPT1000 allows a user to set the option.

<table>
<thead>
<tr>
<th>Option Code</th>

<td>Enable tabbing over the toolbar at the bottom of a page. Toolbar items include buttons that control standard operations on the page, such as Save and Return to Search.</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Understanding Regional Settings

The following table presents the delivered regional settings.

*Note.* PTPT1000 is a delivered permission list that you can use as a starting point for a user permission list. The column shows whether PTPT1000 allows a user to modify the option.

<table>
<thead>
<tr>
<th>Option Code</th>
<th>Description</th>
<th>Default Value</th>
<th>PTPT1000</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADES (Afternoon designator (PM, pm))</td>
<td>(Locale-based) Specify the afternoon designator string to use to indicate PM on a 12 hour display, such as PM or pm. This value has a 5-character limit.</td>
<td>PM</td>
<td>Yes</td>
</tr>
</tbody>
</table>
| DFRMT (Date Format)               | (Locale-based) Specify the format for displaying the date. Select from the following values:  
  - DDMMYY (day first)  
  - MMDDYY (month first)  
  - YYMMDD (year first) | MMDDYY         | Yes      |
<table>
<thead>
<tr>
<th>Option Code</th>
<th>Description</th>
<th>Default Value</th>
<th>PTPT1000</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCSP (Decimal Separator)</td>
<td>(Locale-based) Specify the decimal separator character for values with decimals, such as 1.00 or 1,00. You can enter any single character.</td>
<td>.</td>
<td>No</td>

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>server, where the server may in turn be set to a corporate time zone.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Locale-Based Regional Settings**

Some of the regional settings, as noted in the table, are locale-based. Their values can be determined based on the locale setting of the user’s browser. Because this is one of three sources that can determine which value applies, it’s important to understand which source takes precedence:

- In the Define Personalizations component (PSUSEROPTNDEFINE), you can specify default values for locale-based settings, which apply in the absence of any overriding setting.
- The user’s browser locale setting is used by the PeopleSoft system to invoke the default values of regional settings for that locale, which you can configure on the Locale Defaults page. Each setting for which you configure a value overrides any default value that’s specified for that setting in the Define Personalizations component.
- If a user specifies a value for a locale-based setting in the My Personalizations component, that value overrides any value configured for that setting for the user’s browser locale on the Locale Defaults page. That value also overrides any default value that’s specified for that setting in the Define Personalizations component.

**See Also**

Chapter 15, “Managing PeopleSoft Personalizations,” Working with Locale-Based Personalizations, page 238

**Understanding General Options**

The following table presents the delivered general options.

---

**Note.** PTPT1000 is a delivered permission list that you can use as a starting point for a user permission list. The column shows whether PTPT1000 allows a user to modify the option.
<table>
<thead>
<tr>
<th>Option Code</th>
<th>Description</th>
<th>Default Value</th>
<th>PTPT1000</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCESS (Accessibility Features)</td>
<td>Specify accessibility features. This option provides better support for assistive technologies. Select from the following values:</td>
<td>Accessibility features off</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>• <em>Use accessible layout mode</em> — For use with screen readers. Page elements (fields, links, buttons, and so on) are presented in linear fashion to assistive software.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <em>Use standard layout mode</em> — Supports assistive technologies without altering the page design.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• <em>Accessibility features off</em> — This disables accessibility features.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXCEL97 (Excel 97 grid download)</td>
<td>Indicate that you want to use the character set defined in the user language instead of the default UTF-8 character set when you download a page grid to Microsoft Excel 97.</td>
<td>N</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Enter Y to enable, or N to disable this option.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note.</strong> This option is recommended only for non-English speaking users who use Microsoft Excel 97. It isn’t recommended for Excel in Microsoft Office 2000 and later.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Option Code</td>
<td>Description</td>
<td>Default Value</td>
<td>PTPT1000</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------</td>
<td>----------</td>
</tr>
</tbody>
</table>
| CUSTOMPGSET (Customize Page Set) | Indicate that the Customize Page pagebar link should appear at the top of pages at runtime. Users can use this control to define, share, and copy page personalizations.  
 **Warning**: When this option is disabled, all existing page personalizations for the user are deleted. Grid personalizations aren't affected.  
 **Note**: You can prevent the Customize Page pagebar link from appearing in a given component, regardless of whether users have access to this option, by clearing the Customize Page Link check box in the Internet properties of the component definition.  
 See PeopleTools 8.49 PeopleBook, PeopleSoft Application Designer, "Creating Component Definitions," Setting Component Properties. | Yes           | No       |
| METAXP (Time page held in cache) | Enable browser caching for the navigation pages that remain relatively static. This option specifies the time, in minutes, that portal homepage and navigation pages are held in the cache.  
 You can specify a value between 0 (no caching) and 525600 minutes (one year). | 900           | Yes      |
| MLTLNG (Multi Language Entry) | Enable data entry in multiple languages.  
 On a page where the Data Language drop-down list box is available, users can select a preferred language for data entry on that page.  
 When this option is disabled, the Data Language drop-down list box has no effect. | No            | Yes      |
| SCLANG (Spell Check Dictionary) | Specify the language to use for the spell check dictionary. Users can select from a wide range of supported languages, or use their session language. | Use session language | Yes      |

**See Also**

*Enterprise PeopleTools 8.49 PeopleBook: Internet Technology*, “Using Portal Caching Features”
Understanding System Messages

System messages are those that the system displays for the user when certain events occur, such as a save or a request to view another page. The following table presents the options for system messages.

**Note.** PTPT1000 is a delivered permission list that you can use as a starting point for a user permission list. The column shows whether PTPT1000 allows a user to modify the option.

<table>
<thead>
<tr>
<th>Option Code</th>
<th>Description</th>
<th>Default Setting</th>
<th>PTPT1000</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCNFRM (Save Confirmation)</td>
<td>Display a brief message confirming each save action.</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>SWARN (Save Warning)</td>
<td>Display a warning when the user makes a change and attempts to leave the transaction without saving.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Understanding Internally Controlled Options

Internally controlled personalization options are different from the other personalization option categories. Although they’re defined in the Define Personalizations component (PSUSEROPTNDEFINE), they never appear in My Personalizations, even if you assign them to a permission list.

Instead of accessing these options in My Personalizations, users access and configure them at other locations; the location depends on the individual option. These options are always enabled and can’t be disabled, but you can specify their default settings in the Define Personalizations component.

Query Preferences

You specify the default values of the Query preference options in the Define Personalizations component, and individual users can modify those values in Query preferences. The following personalization options are used by PeopleSoft Query:

**AUTOJOIN**
This option appears as the Enable Auto Join check box on the Query Preferences page. It’s selected by default.

**NAMESTYLE**
This option appears as the Name Style setting on the Query Preferences page. Its default value is *Name and Description*.

**DICTIONARY**
This option is not used in the current release.

**SORTBY**
This option is not used in the current release.

Portal Preference

The following personalization option is used by PeopleSoft internet technology:
PAGEHDRCACHE

**Note.** This option is not available to end users. The default value that you set for it in the Define Personalizations component is the only value used, and it applies globally to all users.

Use PAGEHDRCACHE to configure caching for the PeopleSoft portal navigation header. This option specifies the time, in minutes, that portal headers are held in the cache. The delivered initial value of this option is 480 minutes.

Tree Manager Preference

The following personalization option is used by PeopleSoft Tree Manager:

**TMLINES**

This option appears as the Display Lines Per Page setting on the Configure User Options page of PeopleSoft Tree Manager. Its default value is 60 lines.

Pages Used to Define and Modify Personalizations

<table>
<thead>
<tr>
<th>Page Name</th>
<th>Object Name</th>
<th>Navigation</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Define Personalizations</td>
<td>PSUSEROPTNDEFN</td>
<td>PeopleTools, Personalization, Personalization Options</td>
<td>View, modify, or add personalization option definitions and their formats. View or modify the explanations that end users see in the My Personalization interface.</td>
</tr>
<tr>
<td>Category Groups</td>
<td>USEROPTN_CAT_GRP</td>
<td>PeopleTools, Personalization, Category Groups</td>
<td>View or modify the grouping of options for administrative and ownership purposes.</td>
</tr>
<tr>
<td>Category</td>

<td>PSLOCALEDEFN</td>
<td>PeopleTools, Personalization, Locales</td>
<td>Control the locales for which you can specify defaults.</td>
</tr>
<tr>
<td>Locale Defaults</td>
<td>PSLOCALEOPTNDFLTS</td>
<td>PeopleTools, Personalizations, Locale Defaults</td>
<td>Specify defaults for locales appearing on the Locale Definition page.</td>
</tr>
<tr>
<td>My Personalizations</td>
<td>PSUSERPRSNLCAT</td>
<td>My Personalizations</td>
<td>End users access this page to view and modify personalizations</td>
</tr>
</tbody>
</table>
Defining Personalization Options

This section provides an overview of the Search page and discusses how to:

- Use the Definition tab.
- Use the Format tab.
- Use the Explanation tab.

Note. Adding personalization options involves setting up your options in the Personalizations component, implementing the behavior using PeopleCode, and adding the appropriate permissions through PeopleTools Security. Adding a row to the table using the following interface is only one part of the process.

Understanding the Search Page

To access the personalization definition pages, select PeopleTools, Personalization, Personalization Options. On the search page, you have the option to search by Option Category Level or Description. If you select Option Category Level and click Search, the following result set appears:

- Customer Relationship Management (CRM).
- Custom (CSTM).
- Enterprise Performance Management (EPM).
- Financials (FIN).
- Human Resources (HCM).
- Learning Solutions (LS).
- PeopleTools (PPLT).
- Supply Chain Management (SCM).

Note. These are the only available Option Category Levels. You can’t add custom Option Category Levels.

This list corresponds directly to the collection of PeopleSoft applications. In addition, there is a Custom category where you store any personalization options you create for applications you have built using PeopleTools. You can also add, or extend, the personalizations for each category. For example, if you wanted to add a new personalization to the HCM category, you add it to the list and define it.

This high-level separation of the personalization options enables you to take a modular approach in deploying the options to your user base. It also helps you to avoid collisions by separating equivalent personalization options by application. For example, you can assign different default values for the same personalization for your Human Resources and Financials applications.

Before adding or modifying personalizations, you select the appropriate category. For example, for CRM personalizations, select the CRM category.

Note. Whether you have installed all of the applications listed in the Option Category Level options, the same category levels appear. Ignore any categories that do not apply to your site.

You add and modify the delivered personalization options using the Define Personalizations component.

To access this interface, select PeopleTools, Personalization, Personalization Options. This interface contains the following grid tabs:
Managing PeopleSoft Personalizations

Chapter 15

- Definition
- Format
- Explanation

You use this grid to view and to modify the personalizations within the Category Level you selected on the search page.

Using the Definition Tab

Access the Definition tab.

### Define Personalizations

**Option Category Level:** PeopleTools

<table>
<thead>
<tr>
<th>User Option</th>
<th>Description</th>
<th>Option Category Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCESS</td>
<td>Accessibility Features</td>
<td>Query Preferences</td>
</tr>
<tr>
<td>ADDBTN</td>
<td>Tab over Add/Del Buttons (+/-)</td>
<td>Query Preferences</td>
</tr>
<tr>
<td>ADES</td>
<td>Afternoon designator (PM, pm)</td>
<td>PS Internet Architecture</td>
</tr>
</tbody>
</table>

**Option Category**

<table>
<thead>
<tr>
<th>User Option Type</th>
<th>Locale Based</th>
</tr>
</thead>
<tbody>
<tr>
<td>General Options</td>
<td></td>
</tr>
<tr>
<td>Navigation Personalizations</td>
<td></td>
</tr>
<tr>
<td>Interntl &amp; Regional Settings</td>
<td></td>
</tr>
</tbody>
</table>

**User Option**

Displays the code associated with the user option. This is the code that the system (PeopleCode) recognizes at run time.

**Description**

This is the description of the option that the end user sees on the My Personalizations interface. The description should be unique within the same category. When adding custom personalizations, special attention needs to be paid to this field. Make sure the description is meaningful to end users.

**Option Category Group**

Specify the product or functional groupings of options. This value acts as an administrative attribute providing ownership for maintenance purposes. It further divides the Option Category Level.

**Option Category**

Categorizes and encompasses a set of options for the end user. The option you select determines the button the end user clicks to view and modify the option.

You add new Categories using the Category page.

**User Option Type**

Enables you to set where an option is exposed to the end user for override purposes. There are two options:
Chapter 15 Managing PeopleSoft Personalizations

• **Functional**: Options that users set within an application or tool, such as the Application Designer preferences. Functional personalizations are not exposed to the end user through the personalizations pages. If the users have access to the tool or component, then they are able to override the settings.

• **System**: Options that are exposed directly to the user through the personalization pages. A user can override default values if permission lists grant they authority.

**Locale Based**

Indicates that the option derives the default values based on the Locale of the browser.

To add an option, use the plus-sign button. To delete an option, use the minus-sign button.

**Note.** If you add any custom values for these fields, complete all the appropriate planning beforehand. There is no built-in mechanism to prevent collisions.

**Note.** In the My Personalizations interface, end users see only options that possess the following attributes: the User Option Type is set to System, and permission to override that option is granted by one of the users’ assigned permission lists.

### Using the Format Tab

Access the Format tab.

#### Define Personalizations

<table>
<thead>
<tr>
<th>Option Category Level:</th>
<th>PeopleTools</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Definition</strong></td>
<td><strong>Format</strong></td>
</tr>
<tr>
<td>User Option</td>
<td>Field Format</td>
</tr>
<tr>
<td>ACCESS</td>
<td></td>
</tr>
<tr>
<td>ADETN</td>
<td></td>
</tr>
<tr>
<td>ADES</td>
<td>Uppercase</td>
</tr>
</tbody>
</table>

**User Option**

Shows the code associated with the option.

**Field Format and Field Format Length**

Specify the field characteristic of the option. Used for the Option Default Value for options that are not validated against the database.

**Record (Table) Name**

Specifies the lookup table that holds the personalization options values.

**Field Name**

Specifies the field on the lookup table containing the valid option values.

**Option Default Value**

Shows the current default for the option. This value is set through the Set Option Default Value.

**Set Option Default Value**

This is a link to the secondary page used to set Option Default Values.
Set Option Default Value

The following items appear on the Set Option Default Value page:

**Option Category Level**
Shows the high-level category to which the option belongs, such as PeopleTools or HCM.

**User Option**
Shows the code associated with the option.

**Description**
Shows the description of the option.

**Current Default Value**
Displays the current default value.

**Option Default Value**
Select the appropriate value from the drop down list, or add the appropriate option manually. For options that derive default values from a prompt table, the system displays a drop down list. Otherwise, the system displays an edit box.

Using the Explanation Tab

The Explanation tab enables you to reference the message text and the image (if needed) that the end user sees after clicking the Explain button in the My Personalizations interface.

If you are adding a custom personalization, you’ll need to create the message in the message catalog and create the image (if needed).

Access the Explanation tab.

<table>
<thead>
<tr>
<th>User Option</th>
<th>Message Set Number</th>
<th>Message Number</th>
<th>Image Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCESS</td>
<td>141</td>
<td>16</td>
<td></td>
</tr>
<tr>
<td>ADBTN</td>
<td>141</td>
<td>17 PT_ADD</td>
<td></td>
</tr>
<tr>
<td>ADES</td>
<td>141</td>
<td>18</td>
<td></td>
</tr>
<tr>
<td>AUTOJOIN</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**User Option**
Displays the code associated with an option.

**Message Set Number**
Specify the message set containing the message that contains the explain text.

**Message Number**
Specify the message number of the message containing the explain text.

**Image Name**
Points to the image that the system presents to the end user to provide clarification and context for the personalization. For example, for the "Tab over add button" option, the image of the add button is included so the user can recognize the object.
Chapter 15 Managing PeopleSoft Personalizations

Working with Category Groups

Category groups can represent products, such as Query or Tree Manager, or functional groupings. A category group is an attribute that enables you to designate ownership of personalizations for administrative duties, such as maintenance.

Note. By default, all options created within the category level of Custom appear in the Custom category group.

Access the Category Group page.

<table>
<thead>
<tr>
<th>Category Group</th>
<th>'Object owner identifier'</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APP DESIGNER</td>
<td>PeopleTool</td>
<td>App Designer Preferences</td>
</tr>
<tr>
<td>CUSTOM</td>
<td>PeopleTool</td>
<td>Custom Personalizations</td>
</tr>
<tr>
<td>PIA</td>
<td>PeopleTool</td>
<td>PS Internet Architecture</td>
</tr>
<tr>
<td>PORTAL</td>
<td>PeopleTool</td>
<td>Portal Personalizations</td>
</tr>
<tr>
<td>QUERY</td>
<td>PeopleTool</td>
<td>Query Preferences</td>
</tr>
<tr>
<td>TREE MANAGER</td>
<td>PeopleTool</td>
<td>Tree Manager Preferences</td>
</tr>
</tbody>
</table>

Category Group page

Option Category Group Displays the name of the category group.

Object owner identifier Displays the name of the group responsible for the maintenance of the category group.

Description Provides a description of the category group for identification purposes. This field has a 30-character limit.

Working with Categories

Categories are the way that you group and present personalization options to your end users. For example, for the Navigation option category, the end user sees the description (Navigation Personalizations) on the My Personalizations page. When the end user clicks the adjacent Personalize Options button, they access the options you have grouped in the Navigation category.

Access the Category page.
### Category

<table>
<thead>
<tr>
<th>Category</th>
<th>Object owner identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GENERAL</td>
<td>PeopleTool</td>
<td>General Options</td>
</tr>
<tr>
<td>INTERNAL</td>
<td>PeopleTool</td>
<td>Internally Controlled</td>
</tr>
<tr>
<td>LOCALE</td>
<td>PeopleTool</td>
<td>Regional Settings</td>
</tr>
<tr>
<td>MESSAGES</td>
<td>PeopleTool</td>
<td>System &amp; Application Messages</td>
</tr>
<tr>
<td>NAVIGATION</td>
<td>PeopleTool</td>
<td>Navigation Personalizations</td>
</tr>
</tbody>
</table>

**Option Category**

Shows the name of the category in which options are displayed on the My Personalizations page.

**Object owner identifier**

Displays the name of the group responsible for the maintenance of the category group.

**Description**

Provides a description of the category for identification purposes. This field has a 30-character limit.

**Important!** This is the text that appears on the My Personalization page. If you add custom categories make sure the text is meaningful for end users.

### Working with Locale-Based Personalizations

Locale-based personalizations enable you to handle settings for globalization. Locale-based personalizations are treated separately than the other personalizations.

You use the following pages to manage these personalization options:

- Locale Definition.
- Locale Defaults.

The system derives the locale information based on the locale specified in the browser. PeopleSoft software provides these pages populated with the codes that represent the current browser locales.

This topic is discussed in more detail in the Globalization PeopleBook.

*Enterprise PeopleTools 8.49 PeopleBook: Global Technology*, “Controlling International Preferences,” Setting Up Locale-Based Formatting for the PeopleSoft Pure Internet Architecture
Adding Personalizations to Permission Lists

You assign personalizations to users by way of permission lists in PeopleTools Security. Before doing so, make sure you have added or modified all the necessary personalizations in the Define Personalizations pages. PeopleTools Security only recognizes personalizations that have been defined in the Define Personalizations interface. This topic is covered in the PeopleTools Security documentation.

See Also

Creating Custom Personalization Options

Creating custom personalization options involve the following steps:

1. Define the option using the Define Personalization interface.
   

2. Implement the behavior using PeopleCode personalization options (discussed in the following section).
   

3. To enable users to control the personalization, you need to make the option accessible on the appropriate permission list through PeopleTools Security.

Personalization PeopleCode Functions

There are two PeopleCode functions related to personalizations. These functions are:

- GetUserOption.
- SetUserOption.

If you intend to modify or create custom personalizations, you may need to employ the use of these functions. Refer to the PeopleCode documentation for use and syntax.

</tbody>
</table>

#### Description

The description column contains a brief description for identifying a particular category of personalization options.

#### Personalize Options

Click this button to view and modify the options within a category.

#### Restore Defaults

Click this button to restore the default values for all options in each personalization category. Defaults refer to the initial values that your system administrator has set for each available option—before you modified the option. So, you only use this feature if you have modified one or more personalization option and you want to revert to the initial settings.

### Setting Personalize Options

Access the My Personalizations - Personalize Options page.
### Option Category: Navigation Personalizations

<table>
<thead>
<tr>
<th>Personalization Option</th>

</tbody>
</table>

**My Personalizations - Personalize Options page**

- **Option Category**: Shows the description of the category of personalizations. This helps you to make sure that you have the correct category open.
- **Personalization Option**: This column lists all of the personalization options available for you to modify. The text that appears in the list is a brief description of the option. For more information on the option, click the Explain link.
- **Default Value**: Refers to the initial settings that your administrator has specified for the option. If you do not modify the default value, the option assumes the value provided by the system administrator.
- **Override Value**: Enter any custom value you want to assign to the personalization option. To override a default setting means to use the new value in place of the default setting.
- **Explain**: Click this link to view more information on what the personalization option provides. See the following section for more information on the Explanation page.
- **Restore Category Defaults**: Returns all modified options to the default values. This button applies only to the current category, as in the category you have open.
- **OK/Cancel**: After you have made any modifications, click OK so that the system records your changes. If you do not want your changes recorded click Cancel. If you have not made any changes and just viewed the options, you can use either button to return to the Personalizations page.
Using the Personalization Explanation Page

Click Explain on the Option Category page to access the Personalization Explanation page.

<table>
<thead>
<tr>
<th>Personalization Name</th>

<td><img src="image" alt="Image" />  <img src="image" alt="Save" />  <img src="image" alt="Return to Search" />  <img src="image" alt="Next in List" />  <img src="image" alt="Previous in List" />  <img src="image" alt="Related Links" />  <img src="image" alt="Add" />  <img src="image" alt="Update/Display" /></td>
</tr>
</tbody>
</table>

Personalization Explanation page

- **Personalization Name**: The name of the individual personalization appears at the top of this page so that you can make sure you are viewing or modifying the appropriate option.
- **Default Value**: Shows the value that your system administrator has set as the default value for an option. The personalization assumes the default value unless you override it.
- **Override Value**: Overrides the default value. For example, if the default value for an option is No, you can override the default value to be Yes.
- **Restore Option to Default**: Enables you to change any option value that you’ve modified to assume the original default value specified by your system administrator.
- **Explanation**: Contains the description of what the personalization option provides when activated. For longer descriptions, use the scroll bar to view. This box is read-only.
- **Image**: In many cases, especially with the Navigation options, an image appears to provide further clarification as to a specific control or item that the option affects.

For example, on the explanation page for the Tab Over Toolbar option, an image of the toolbar appears in the image section to show exactly the area on the page that the personalization affects.

- **OK/Cancel**: Returns you to the current Option Category page. If you’ve made changes to the personalization option that you want to keep, click OK. If you do not want to keep the changes you have made, click Cancel. If you have made no changes, use either button.
Modifying a Personalization Option

The following procedure describes the steps you need to complete to modify a personalization option.

To modify a personalization option:

1. Select My Personalizations from the portal menu.
2. On the Personalizations page, click the Personalize Options button adjacent to the category of personalization options you want to modify.
3. In the Personalization Option list, locate the option you want to modify.
4. In the corresponding Override Value edit box specify the appropriate override value.
   Depending on the option, you will see one of the following controls.
   - A drop-down list box.
     Select the appropriate option from the drop-down list.
   - An edit box.
     Manually enter an override value.
5. Click OK.
   This saves the change to the system.
6. Sign out and then sign in again to view your changes.
Glossary of PeopleSoft Enterprise Terms

absence entitlement  This element defines rules for granting paid time off for valid absences, such as sick time, vacation, and maternity leave. An absence entitlement element defines the entitlement amount, frequency, and entitlement period.

absence take  This element defines the conditions that must be met before a payee is entitled to take paid time off.

academic career  In PeopleSoft Enterprise Campus Solutions, all course work that a student undertakes at an academic institution and that is grouped in a single student record. For example, a university that has an undergraduate school, a graduate school, and various professional schools might define several academic careers—an undergraduate career, a graduate career, and separate careers for each professional school (law school, medical school, dental school, and so on).

academic institution  In PeopleSoft Enterprise Campus Solutions, an entity (such as a university or college) that is independent of other similar entities and that has its own set of rules and business processes.

academic organization  In PeopleSoft Enterprise Campus Solutions, an entity that is part of the administrative structure within an academic institution. At the lowest level, an academic organization might be an academic department. At the highest level, an academic organization can represent a division.

academic plan  In PeopleSoft Enterprise Campus Solutions, an area of study—such as a major, minor, or specialization—that exists within an academic program or academic career.

academic program  In PeopleSoft Enterprise Campus Solutions, the entity to which a student applies and is admitted and from which the student graduates.

accounting class  In PeopleSoft Enterprise Performance Management, the accounting class defines how a resource is treated for generally accepted accounting practices. The Inventory class indicates whether a resource becomes part of a balance sheet account, such as inventory or fixed assets, while the Non-inventory class indicates that the resource is treated as an expense of the period during which it occurs.

accounting date  The accounting date indicates when a transaction is recognized, as opposed to the date the transaction actually occurred. The accounting date and transaction date can be the same. The accounting date determines the period in the general ledger to which the transaction is to be posted. You can only select an accounting date that falls within an open period in the ledger to which you are posting. The accounting date for an item is normally the invoice date.

accounting split  The accounting split method indicates how expenses are allocated or divided among one or more sets of accounting ChartFields.

accumulator  You use an accumulator to store cumulative values of defined items as they are processed. You can accumulate a single value over time or multiple values over time. For example, an accumulator could consist of all voluntary deductions, or all company deductions, enabling you to accumulate amounts. It allows total flexibility for time periods and values accumulated.

action reason  The reason an employee’s job or employment information is updated. The action reason is entered in two parts: a personnel action, such as a promotion, termination, or change from one pay group to another—and a reason for that action. Action reasons are used by PeopleSoft Enterprise Human Resources, PeopleSoft Enterprise Benefits
Administration, PeopleSoft Enterprise Stock Administration, and the COBRA Administration feature of the Base Benefits business process.

**action template**

In PeopleSoft Enterprise Receivables, outlines a set of escalating actions that the system or user performs based on the period of time that a customer or item has been in an action plan for a specific condition.

**activity**

In PeopleSoft Enterprise Learning Management, an instance of a catalog item (sometimes called a class) that is available for enrollment. The activity defines such things as the costs that are associated with the offering, enrollment limits and deadlines, and waitlisting capacities.

In PeopleSoft Enterprise Performance Management, the work of an organization and the aggregation of actions that are used for activity-based costing.

In PeopleSoft Enterprise Project Costing, the unit of work that provides a further breakdown of projects—usually into specific tasks.

In PeopleSoft Workflow, a specific transaction that you might need to perform in a business process. Because it consists of the steps that are used to perform a transaction, it is also known as a step map.

**address usage**

In PeopleSoft Enterprise Campus Solutions, a grouping of address types defining the order in which the address types are used. For example, you might define an address usage code to process addresses in the following order: billing address, dormitory address, home address, and then work address.

**adjustment calendar**

In PeopleSoft Enterprise Campus Solutions, the adjustment calendar controls how a particular charge is adjusted on a student’s account when the student drops classes or withdraws from a term. The charge adjustment is based on how much time has elapsed from a predetermined date, and it is determined as a percentage of the original charge amount.

**administrative function**

In PeopleSoft Enterprise Campus Solutions, a particular functional area that processes checklists, communication, and comments. The administrative function identifies which variable data is added to a person’s checklist or communication record when a specific checklist code, communication category, or comment is assigned to the student. This key data enables you to trace that checklist, communication, or comment back to a specific processing event in a functional area.

**admit type**

In PeopleSoft Enterprise Campus Solutions, a designation used to distinguish first-year applications from transfer applications.

**agreement**

In PeopleSoft Enterprise eSettlements, provides a way to group and specify processing options, such as payment terms, pay from a bank, and notifications by a buyer and supplier location combination.

**allocation rule**

In PeopleSoft Enterprise Incentive Management, an expression within compensation plans that enables the system to assign transactions to nodes and participants. During transaction allocation, the allocation engine traverses the compensation structure from the current node to the root node, checking each node for plans that contain allocation rules.

**alternate account**

A feature in PeopleSoft Enterprise General Ledger that enables you to create a statutory chart of accounts and enter statutory account transactions at the detail transaction level, as required for recording and reporting by some national governments.

**analysis database**

In PeopleSoft Enterprise Campus Solutions, database tables that store large amounts of student information that may not appear in standard report formats. The analysis database tables contain keys for all objects in a report that an application program can use to reference other student-record objects that are not contained in the printed report. For instance, the analysis database contains data on courses that are considered
for satisfying a requirement but that are rejected. It also contains information on courses captured by global limits. An analysis database is used in PeopleSoft Enterprise Academic Advisement.

**Application Messaging**
PeopleSoft Application Messaging enables applications within the PeopleSoft Enterprise product family to communicate synchronously or asynchronously with other PeopleSoft Enterprise and third-party applications. An application message defines the records and fields to be published or subscribed to.

**AR specialist**
Abbreviation for *receivables specialist*. In PeopleSoft Enterprise Receivables, an individual who tracks and resolves deductions and disputed items.

**arbitration plan**
The arbiter when multiple price rules match the transaction. This plan determines the order in which the price rules are applied to the transaction base price.

**assessment rule**
In PeopleSoft Enterprise Receivables, a user-defined rule that the system uses to evaluate the condition of a customer’s account or of individual items to determine whether to generate a follow-up action.

**asset class**
An asset group used for reporting purposes. It can be used in conjunction with the asset category to refine asset classification.

**attribute/value pair**
In PeopleSoft Enterprise Directory Interface, relates the data that makes up an entry in the directory information tree.

**auction event**
In PeopleSoft Strategic Sourcing, a sourcing event where bidders actively compete against one another to achieve the best price or score.

**audience**
In PeopleSoft Enterprise Campus Solutions, a segment of the database that relates to an initiative, or a membership organization that is based on constituent attributes rather than a dues-paying structure. Examples of audiences include the Class of ’65 and Undergraduate Arts & Sciences.

**authentication server**
A server that is set up to verify users of the system.

**base time period**
In PeopleSoft Enterprise Business Planning, the lowest level time period in a calendar.

**benchmark job**
In PeopleSoft Enterprise Workforce Analytics Solution, a benchmark job is a job code for which there is corresponding salary survey data from published, third-party sources.

**bid response**
In PeopleSoft Strategic Sourcing, the response by a bidder to an event.

**billing career**
In PeopleSoft Enterprise Campus Solutions, the one career under which other careers are grouped for billing purposes if a student is active simultaneously in multiple careers.

**bio bit or bio brief**
In PeopleSoft Enterprise Campus Solutions, a report that summarizes information stored in the system about a particular constituent. You can generate standard or specialized reports.

**book**
In PeopleSoft Enterprise Asset Management, used for storing financial and tax information, such as costs, depreciation attributes, and retirement information on assets.

**branch**
A tree node that rolls up to nodes above it in the hierarchy, as defined in PeopleSoft Tree Manager.

**budgetary account only**
An account used by the system only and not by users; this type of account does not accept transactions. You can only budget with this account. Formerly called “system-maintained account.”
<p>| <strong>Budget Check</strong> | In commitment control, the processing of source transactions against control budget ledgers, to see if they pass, fail, or pass with a warning. |
| <strong>Budget Control</strong> | In commitment control, budget control ensures that commitments and expenditures don’t exceed budgets. It enables you to track transactions against corresponding budgets and terminate a document’s cycle if the defined budget conditions are not met. For example, you can prevent a purchase order from being dispatched to a vendor if there are insufficient funds in the related budget to support it. |
| <strong>Budget Period</strong> | The interval of time (such as 12 months or 4 quarters) into which a period is divided for budgetary and reporting purposes. The ChartField allows maximum flexibility to define operational accounting time periods without restriction to only one calendar. |
| <strong>Business Activity</strong> | The name of a subset of a detailed business process. This might be a specific transaction, task, or action that you perform in a business process. |
| <strong>Business Event</strong> | In PeopleSoft Enterprise Receivables, defines the processing characteristics for the Receivable Update process for a draft activity. In PeopleSoft Enterprise Sales Incentive Management, an original business transaction or activity that may justify the creation of a PeopleSoft Enterprise Incentive Management event (a sale, for example). |
| <strong>Business Process</strong> | A standard set of 17 business processes are defined and maintained by the PeopleSoft Enterprise product families and are supported by the Business Process Engineering group. An example of a business process is Order Fulfillment, which is a business process that manages sales orders and contracts, inventory, billing, and so forth. See also detailed business process. |
| <strong>Business Unit Constraints</strong> | In PeopleSoft Strategic Sourcing, these constraints apply to a selected Strategic Sourcing business unit. Spend is tracked across all of the events within the selected Strategic Sourcing business unit. |
| <strong>Business Task</strong> | The name of the specific function depicted in one of the business processes. |
| <strong>Business Unit</strong> | A corporation or a subset of a corporation that is independent with regard to one or more operational or accounting functions. |
| <strong>Buyer</strong> | In PeopleSoft Enterprise eSettlements, an organization (or business unit, as opposed to an individual) that transacts with suppliers (vendors) within the system. A buyer creates payments for purchases that are made in the system. |
| <strong>Buy Event</strong> | In PeopleSoft Strategic Sourcing, for event creators, the purchase of goods or services, most typically associated with a request for quote, proposal, or reverse auction. For bidders, the sale of goods or services. |
| <strong>Campus</strong> | In PeopleSoft Enterprise Campus Solutions, an entity that is usually associated with a distinct physical administrative unit, that belongs to a single academic institution, that uses a unique course catalog, and that produces a common transcript for students within the same academic career. |
| <strong>Cash Drawer</strong> | A repository for monies and payments taken locally. |
| <strong>Catalog Item</strong> | In PeopleSoft Enterprise Learning Management, a specific topic that a learner can study and have tracked. For example, “Introduction to Microsoft Word.” A catalog item contains general information about the topic and includes a course code, description, categorization, keywords, and delivery methods. A catalog item can have one or more learning activities. |
| <strong>Catalog Map</strong> | In PeopleSoft Enterprise Catalog Management, translates values from the catalog source data to the format of the company’s catalog. |</p>
<table>
<thead>
<tr>
<th><strong>catalog partner</strong></th>
<th>In PeopleSoft Enterprise Catalog Management, shares responsibility with the enterprise catalog manager for maintaining catalog content.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>categorization</strong></td>
<td>Associates partner offerings with catalog offerings and groups them into enterprise catalog categories.</td>
</tr>
<tr>
<td><strong>category</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, a broad grouping to which specific comments or communications (contexts) are assigned. Category codes are also linked to 3C access groups so that you can assign data-entry or view-only privileges across functions.</td>
</tr>
<tr>
<td><strong>channel</strong></td>
<td>In PeopleSoft MultiChannel Framework, email, chat, voice (computer telephone integration [CTI]), or a generic event.</td>
</tr>
<tr>
<td><strong>ChartField</strong></td>
<td>A field that stores a chart of accounts, resources, and so on, depending on the PeopleSoft Enterprise application. ChartField values represent individual account numbers, department codes, and so forth.</td>
</tr>
<tr>
<td><strong>ChartField balancing</strong></td>
<td>You can require specific ChartFields to match up (balance) on the debit and the credit side of a transaction.</td>
</tr>
<tr>
<td><strong>ChartField combination edit</strong></td>
<td>The process of editing journal lines for valid ChartField combinations based on user-defined rules.</td>
</tr>
<tr>
<td><strong>ChartKey</strong></td>
<td>One or more fields that uniquely identify each row in a table. Some tables contain only one field as the key, while others require a combination.</td>
</tr>
<tr>
<td><strong>checkbook</strong></td>
<td>In PeopleSoft Enterprise Promotions Management, enables you to view financial data (such as planned, incurred, and actual amounts) that is related to funds and trade promotions.</td>
</tr>
<tr>
<td><strong>checklist code</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, a code that represents a list of planned or completed action items that can be assigned to a staff member, volunteer, or unit. Checklists enable you to view all action assignments on one page.</td>
</tr>
<tr>
<td><strong>claimback</strong></td>
<td>In the wholesale distribution industry, a contract between supplier and distributor, in which monies are paid to the distributor on the sale of specified products or product groups to targeted customers or customer groups.</td>
</tr>
<tr>
<td><strong>class</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, a specific offering of a course component within an academic term. See also course.</td>
</tr>

<tr>
<td>configuration plan</td>
<td>In PeopleSoft Enterprise Incentive Management, configuration plans hold allocation information for common variables (not incentive rules) and are attached to a node without a participant. Configuration plans are not processed by transactions.</td>
</tr>
<tr>
<td>constituents</td>
<td>In PeopleSoft Enterprise Campus Solutions, friends, alumni, organizations, foundations, or other entities affiliated with the institution, and about which the institution maintains information. The constituent types delivered with PeopleSoft Enterprise Contributor Relations Solutions are based on those defined by the Council for the Advancement and Support of Education (CASE).</td>
</tr>
<tr>
<td>constraint</td>
<td>A business policy or rule that affects how a sourcing event is awarded. There are three types of constraints: business, global, and event.</td>
</tr>
<tr>
<td>content reference</td>
<td>Content references are pointers to content registered in the portal registry. These are typically either URLs or iScripts. Content references fall into three categories: target content, templates, and template pagelets.</td>
</tr>
<tr>
<td>context</td>
<td>In PeopleCode, determines which buffer fields can be contextually referenced and which is the current row of data on each scroll level when a PeopleCode program is running. In PeopleSoft Enterprise Campus Solutions, a specific instance of a comment or communication. One or more contexts are assigned to a category, which you link to</td>
</tr>
</tbody>
</table>
3C access groups so that you can assign data-entry or view-only privileges across functions.

In PeopleSoft Enterprise Incentive Management, a mechanism that is used to determine the scope of a processing run. PeopleSoft Enterprise Incentive Management uses three types of context: plan, period, and run-level.

control table
Stores information that controls the processing of an application. This type of processing might be consistent throughout an organization, or it might be used only by portions of the organization for more limited sharing of data.

cost plus contract line
A rate-based contract line associated with a fee component of Award, Fixed, Incentive, or Other. Rate-based contract lines associated with a fee type of None are not considered cost-plus contract lines.

cost plus pricing
In PeopleSoft Enterprise Pricer, a pricing method that begins with cost of goods as the basis.

cost profile
A combination of a receipt cost method, a cost flow, and a deplete cost method. A profile is associated with a cost book and determines how items in that book are valued, as well as how the material movement of the item is valued for the book.

cost row
A cost transaction and amount for a set of ChartFields.

counter sale
A face-to-face customer transaction where the customer typically selects items from the storefront or picks up products that they ordered ahead of time. Customers pay for the goods at the counter and take the goods with them instead of having the goods shipped from a warehouse.

course
In PeopleSoft Enterprise Campus Solutions, a course that is offered by a school and that is typically described in a course catalog. A course has a standard syllabus and credit level; however, these may be modified at the class level. Courses can contain multiple components such as lecture, discussion, and lab.

See also class.

course share set
In PeopleSoft Enterprise Campus Solutions, a tag that defines a set of requirement groups that can share courses. Course share sets are used in PeopleSoft Enterprise Academic Advisement.

current learning
In PeopleSoft Enterprise Learning Management, a self-service repository for all of a learner’s in-progress learning activities and programs.

data acquisition
In PeopleSoft Enterprise Incentive Management, the process during which raw business transactions are acquired from external source systems and fed into the operational data store (ODS).

data cube
In PeopleSoft Analytic Calculation Engine, a data cube is a container for one kind of data (such as Sales data) and works with in tandem with one or more dimensions. Dimensions and data cubes in PeopleSoft Analytic Calculation Engine are unrelated to dimensions and online analytical processing (OLAP) cubes in PeopleSoft Cube Manager.

data elements
Data elements, at their simplest level, define a subset of data and the rules by which to group them.

For Workforce Analytics, data elements are rules that tell the system what measures to retrieve about your workforce groups.

dataset
A data grouping that enables role-based filtering and distribution of data. You can limit the range and quantity of data that is displayed for a user by associating dataset rules with user roles. The result of dataset rules is a set of data that is appropriate for the user’s roles.
delivery method
In PeopleSoft Enterprise Learning Management, identifies the primary type of delivery method in which a particular learning activity is offered. Also provides default values for the learning activity, such as cost and language. This is primarily used to help learners search the catalog for the type of delivery from which they learn best. Because PeopleSoft Enterprise Learning Management is a blended learning system, it does not enforce the delivery method.

In PeopleSoft Enterprise Supply Chain Management, identifies the method by which goods are shipped to their destinations (such as truck, air, and rail). The delivery method is specified when creating shipment schedules.

delivery method type
In PeopleSoft Enterprise Learning Management, identifies how learning activities can be delivered—for example, through online learning, classroom instruction, seminars, books, and so forth—in an organization. The type determines whether the delivery method includes scheduled components.

detailed business process
A subset of the business process. For example, the detailed business process named Determine Cash Position is a subset of the business process called Cash Management.

dimension
In PeopleSoft Analytic Calculation Engine, a dimension contains a list of one kind of data that can span various contexts, and it is a basic component of an analytic model. Within the analytic model, a dimension is attached to one or more data cubes. In PeopleSoft Cube Manager, a dimension is the most basic component of an OLAP cube and specifies the PeopleSoft metadata to be used to create the dimension’s rollup structure. Dimensions and data cubes in PeopleSoft Analytic Calculation Engine are unrelated to dimensions and OLAP cubes in PeopleSoft Cube Manager.

direct receipt
Items shipped from a warehouse or vendor to another warehouse.

direct ship
Items shipped from the vendor or warehouse directly to the customer (formerly referred to as drop ship).

directory information tree
In PeopleSoft Enterprise Directory Interface, the representation of a directory’s hierarchical structure.

division
In PeopleSoft Enterprise Campus Solutions, the lowest level of the three-level classification structure that you define in PeopleSoft Enterprise Recruiting and Admissions for enrollment management. You can define a division level, link it to other levels, and set enrollment target numbers for it.
See also population and cohort.

document sequencing
A flexible method that sequentially numbers the financial transactions (for example, bills, purchase orders, invoices, and payments) in the system for statutory reporting and for tracking commercial transaction activity.

dynamic detail tree
A tree that takes its detail values—dynamic details—directly from a table in the database, rather than from a range of values that are entered by the user.

edit table
A table in the database that has its own record definition, such as the Department table. As fields are entered into a PeopleSoft Enterprise application, they can be validated against an edit table to ensure data integrity throughout the system.

effective date
A method of dating information in PeopleSoft Enterprise applications. You can predate information to add historical data to your system, or postdate information in order to enter it before it actually goes into effect. By using effective dates, you don’t delete values; you enter a new value with a current effective date.

EIM ledger
Abbreviation for Enterprise Incentive Management ledger. In PeopleSoft Enterprise Incentive Management, an object to handle incremental result gathering within the scope of a participant. The ledger captures a result set with all of the appropriate traces to the data origin and to the processing steps of which it is a result.
elimination set  In PeopleSoft Enterprise General Ledger, a related group of intercompany accounts that is processed during consolidations.

entry event  In PeopleSoft Enterprise General Ledger, Receivables, Payables, Purchasing, and Billing, a business process that generates multiple debits and credits resulting from single transactions to produce standard, supplemental accounting entries.

equitization  In PeopleSoft Enterprise General Ledger, a business process that enables parent companies to calculate the net income of subsidiaries on a monthly basis and adjust that amount to increase the investment amount and equity income amount before performing consolidations.

equity item limit  In PeopleSoft Enterprise Campus Solutions, the amounts of funds set by the institution to be awarded with discretionary or gift funds. The limit could be reduced by amounts equal to such things as expected family contribution (EFC) or parent contribution. Students are packaged by Equity Item Type Groups and Related Equity Item Types. This limit can be used to assure that similar student populations are packaged equally.

event  A predefined point either in the Component Processor flow or in the program flow. As each point is encountered, the event activates each component, triggering any PeopleCode program that is associated with that component and that event. Examples of events are FieldChange, SavePreChange, and RowDelete.

In PeopleSoft Enterprise Human Resources, also refers to an incident that affects benefits eligibility.

event constraints  In PeopleSoft Strategic Sourcing, these constraints are associated with a specific sourcing event. Spend is tracked within the selected event.

event propagation process  In PeopleSoft Enterprise Sales Incentive Management, a process that determines, through logic, the propagation of an original PeopleSoft Enterprise Incentive Management event and creates a derivative (duplicate) of the original event to be processed by other objects. PeopleSoft Enterprise Enterprise Sales Incentive Management uses this mechanism to implement splits, roll-ups, and so on. Event propagation determines who receives the credit.

exception  In PeopleSoft Enterprise Receivables, an item that either is a deduction or is in dispute.

exclusive pricing  In PeopleSoft Enterprise Order Management, a type of arbitration plan that is associated with a price rule. Exclusive pricing is used to price sales order transactions.

fact  In PeopleSoft Enterprise applications, facts are numeric data values from fields from a source database as well as an analytic application. A fact can be anything you want to measure your business by, for example, revenue, actual, budget data, or sales numbers. A fact is stored on a fact table.

financial aid term  In PeopleSoft Enterprise Campus Solutions, a combination of a period of time that the school determines as an instructional accounting period and an academic career. It is created and defined during the setup process. Only terms eligible for financial aid are set up for each financial aid career.

financial sanctions  For U.S. based companies and their foreign subsidiaries, a federal regulation from the Office of Foreign Assets Control (OFAC) requires that vendors be validated against a Specially Designated Nationals (SDN) list prior to payment.

For PeopleSoft Payables, eSettlements, Cash Management, and Order to Cash, you can validate your vendors against any financial sanctions list (for example, the SDN list, a European Union list, and so on).

forecast item  A logical entity with a unique set of descriptive demand and forecast data that is used as the basis to forecast demand. You create forecast items for a wide range of uses, but they ultimately represent things that you buy, sell, or use in your organization and for which you require a predictable usage.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>fund</td>
<td>In PeopleSoft Enterprise Promotions Management, a budget that can be used to fund promotional activity. There are four funding methods: top down, fixed accrual, rolling accrual, and zero-based accrual.</td>
</tr>
<tr>
<td>gap</td>
<td>In PeopleSoft Enterprise Campus Solutions, an artificial figure that sets aside an amount of unmet financial aid need that is not funded with Title IV funds. A gap can be used to prevent fully funding any student to conserve funds, or it can be used to preserve unmet financial aid need so that institutional funds can be awarded.</td>
</tr>
<tr>
<td>generic process type</td>
<td>In PeopleSoft Process Scheduler, process types are identified by a generic process type. For example, the generic process type SQR includes all SQR process types, such as SQR process and SQR report.</td>
</tr>
<tr>
<td>gift table</td>
<td>In PeopleSoft Enterprise Campus Solutions, a table or so-called donor pyramid describing the number and size of gifts that you expect will be needed to successfully complete the campaign in PeopleSoft Enterprise Contributor Relations. The gift table enables you to estimate the number of donors and prospects that you need at each gift level to reach the campaign goal.</td>
</tr>
<tr>
<td>GDS</td>
<td>Abbreviation for Global Distribution System. Broad-based term to describe all computer reservation systems for making travel plans.</td>
</tr>
<tr>
<td>GL business unit</td>
<td>Abbreviation for general ledger business unit. A unit in an organization that is an independent entity for accounting purposes. It maintains its own set of accounting books. See also business unit.</td>
</tr>
<tr>
<td>GL entry template</td>
<td>Abbreviation for general ledger entry template. In PeopleSoft Enterprise Campus Solutions, a template that defines how a particular item is sent to the general ledger. An item-type maps to the general ledger, and the GL entry template can involve multiple general ledger accounts. The entry to the general ledger is further controlled by high-level flags that control the summarization and the type of accounting—that is, accrual or cash.</td>
</tr>
<tr>
<td>GL Interface process</td>
<td>Abbreviation for General Ledger Interface process. In PeopleSoft Enterprise Campus Solutions, a process that is used to send transactions from PeopleSoft Enterprise Student Financials to the general ledger. Item types are mapped to specific general ledger accounts, enabling transactions to move to the general ledger when the GL Interface process is run.</td>
</tr>
<tr>
<td>global constraints</td>
<td>In PeopleSoft Strategic Sourcing, these constraints apply across multiple Strategic Sourcing business units. Spend is tracked across all of the events from the multiple Strategic Sourcing business units.</td>
</tr>
<tr>
<td>group</td>
<td>In PeopleSoft Enterprise Billing and Receivables, a posting entity that comprises one or more transactions (items, deposits, payments, transfers, matches, or write-offs). In PeopleSoft Enterprise Human Resources Management and Supply Chain Management, any set of records that are associated under a single name or variable to run calculations in PeopleSoft business processes. In PeopleSoft Enterprise Time and Labor, for example, employees are placed in groups for time reporting purposes.</td>
</tr>
<tr>
<td>ideal response</td>
<td>In PeopleSoft Strategic Sourcing, a question that requires the response to match the ideal value for the bid to be considered eligible for award. If the response does not match the ideal value, you can still submit the bid, but it will be disqualified and ineligible for award.</td>
</tr>
<tr>
<td>incentive object</td>
<td>In PeopleSoft Enterprise Incentive Management, the incentive-related objects that define and support the PeopleSoft Enterprise Incentive Management calculation process and results, such as plan templates, plans, results data, and user interaction objects.</td>
</tr>
<tr>
<td><strong>incentive rule</strong></td>
<td>In PeopleSoft Enterprise Sales Incentive Management, the commands that act on transactions and turn them into compensation. A rule is one part in the process of turning a transaction into compensation.</td>
</tr>
<tr>
<td><strong>incurred</strong></td>
<td>In PeopleSoft Enterprise Promotions Management, to become liable for a promotional payment. In other words, you owe that amount to a customer for promotional activities.</td>
</tr>
<tr>
<td><strong>initiative</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, the basis from which all advancement plans are executed. It is an organized effort targeting a specific constituency, and it can occur over a specified period of time with specific purposes and goals. An initiative can be a campaign, an event, an organized volunteer effort, a membership drive, or any other type of effort defined by the institution. Initiatives can be multipart, and they can be related to other initiatives. This enables you to track individual parts of an initiative, as well as entire initiatives.</td>
</tr>
<tr>
<td><strong>inquiry access</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, a type of security access that permits the user only to view data. See also update access.</td>
</tr>
<tr>
<td><strong>institution</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, an entity (such as a university or college) that is independent of other similar entities and that has its own set of rules and business processes.</td>
</tr>
<tr>
<td><strong>integration</strong></td>
<td>A relationship between two compatible integration points that enables communication to take place between systems. Integrations enable PeopleSoft Enterprise applications to work seamlessly with other PeopleSoft Enterprise applications or with third-party systems or software.</td>
</tr>
<tr>
<td><strong>integration point</strong></td>
<td>An interface that a system uses to communicate with another PeopleSoft Enterprise application or an external application.</td>
</tr>
<tr>
<td><strong>integration set</strong></td>
<td>A logical grouping of integrations that applications use for the same business purpose. For example, the integration set ADVANCED_SHIPPING_ORDER contains all of the integrations that notify a customer that an order has shipped.</td>
</tr>
<tr>
<td><strong>item</strong></td>
<td>In PeopleSoft Enterprise Inventory, a tangible commodity that is stored in a business unit (shipped from a warehouse). In PeopleSoft Enterprise Demand Planning, Inventory Policy Planning, and Supply Planning, a noninventory item that is designated as being used for planning purposes only. It can represent a family or group of inventory items. It can have a planning bill of material (BOM) or planning routing, and it can exist as a component on a planning BOM. A planning item cannot be specified on a production or engineering BOM or routing, and it cannot be used as a component in a production. The quantity on hand will never be maintained. In PeopleSoft Enterprise Receivables, an individual receivable. An item can be an invoice, a credit memo, a debit memo, a write-off, or an adjustment.</td>
</tr>
<tr>
<td><strong>item shuffle</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, a process that enables you to change a payment allocation without having to reverse the payment.</td>
</tr>
<tr>
<td><strong>itinerary</strong></td>
<td>In PeopleSoft Expenses, a collection of travel reservations. Itineraries can have reservations that are selected and reserved with the travel vendor. These itineraries are not yet paid for and can be referred to as pending reservations. Reservations that have been paid for are referred to as confirmed reservations.</td>
</tr>
<tr>
<td><strong>joint communication</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, one letter that is addressed jointly to two people. For example, a letter might be addressed to both Mr. Sudhir Awat and Ms. Samantha Mortelli. A relationship must be established between the two individuals in the database, and at least one of the individuals must have an ID in the database.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>keyword</td>
<td>In PeopleSoft Enterprise Campus Solutions, a term that you link to particular elements within PeopleSoft Enterprise Student Financials, Financial Aid, and Contributor Relations. You can use keywords as search criteria that enable you to locate specific records in a search dialog box.</td>
</tr>
<tr>
<td>KPI</td>
<td>An abbreviation for key performance indicator. A high-level measurement of how well an organization is doing in achieving critical success factors. This defines the data value or calculation upon which an assessment is determined.</td>
</tr>
<tr>
<td>KVI</td>
<td>Abbreviation for Known Value Item. Term used for products or groups of products where the selling price cannot be reduced or increased.</td>
</tr>
<tr>
<td>landlord</td>
<td>In PeopleSoft Real Estate Management, an entity that owns real estate and leases the real estate to tenants.</td>
</tr>
<tr>
<td>learner group</td>
<td>In PeopleSoft Enterprise Learning Management, a group of learners who are linked to the same learning environment. Members of the learner group can share the same attributes, such as the same department or job code. Learner groups are used to control access to and enrollment in learning activities and programs. They are also used to perform group enrollments and mass enrollments in the back office.</td>
</tr>
<tr>
<td>learning components</td>
<td>In PeopleSoft Enterprise Learning Management, the foundational building blocks of learning activities. PeopleSoft Enterprise Learning Management supports six basic types of learning component types: web-based, session, webcast, test, survey, and assignment. One or more of these learning component types compose a single learning activity.</td>
</tr>
<tr>
<td>learning environment</td>
<td>In PeopleSoft Enterprise Learning Management, identifies a set of categories and catalog items that can be made available to learner groups. Also defines the default values that are assigned to the learning activities and programs that are created within a particular learning environment. Learning environments provide a way to partition the catalog so that learners see only those items that are relevant to them.</td>
</tr>
<tr>
<td>learning history</td>
<td>In PeopleSoft Enterprise Learning Management, a self-service repository for all of a learner’s completed learning activities and programs.</td>
</tr>
<tr>
<td>lease</td>
<td>In PeopleSoft Real Estate Management, a legally binding agreement between a landlord and a tenant, where the tenant rents all or part of a physical property from the landlord.</td>
</tr>
<tr>
<td>lease abstract</td>
<td>In PeopleSoft Real Estate Management, a summarized version of the complete lease contract with only the important terms. The lease abstract usually fits on one page and does not include legal terminology.</td>
</tr>
<tr>
<td>ledger mapping</td>
<td>You use ledger mapping to relate expense data from general ledger accounts to resource objects. Multiple ledger line items can be mapped to one or more resource IDs. You can also use ledger mapping to map dollar amounts (referred to as rates) to business units. You can map the amounts in two different ways: an actual amount that represents actual costs of the accounting period, or a budgeted amount that can be used to calculate the capacity rates as well as budgeted model results. In PeopleSoft Enterprise Warehouse, you can map general ledger accounts to the EW Ledger table.</td>
</tr>
<tr>
<td>library section</td>
<td>In PeopleSoft Enterprise Incentive Management, a section that is defined in a plan (or template) and that is available for other plans to share. Changes to a library section are reflected in all plans that use it.</td>
</tr>
<tr>
<td>line</td>
<td>In PeopleSoft Strategic Sourcing, an individual item or service upon which there can be a bid.</td>
</tr>
</tbody>
</table>
linked section  In PeopleSoft Enterprise Incentive Management, a section that is defined in a plan template but appears in a plan. Changes to linked sections propagate to plans using that section.

linked variable  In PeopleSoft Enterprise Incentive Management, a variable that is defined and maintained in a plan template and that also appears in a plan. Changes to linked variables propagate to plans using that variable.

LMS  Abbreviation for learning management system. In PeopleSoft Enterprise Campus Solutions, LMS is a PeopleSoft Enterprise Student Records feature that provides a common set of interoperability standards that enable the sharing of instructional content and data between learning and administrative environments.

load  In PeopleSoft Enterprise Inventory, identifies a group of goods that are shipped together. Load management is a feature of PeopleSoft Enterprise Inventory that is used to track the weight, the volume, and the destination of a shipment.

local functionality  In PeopleSoft Enterprise HRMS, the set of information that is available for a specific country. You can access this information when you click the appropriate country flag in the global window, or when you access it by a local country menu.

location  Locations enable you to indicate the different types of addresses—for a company, for example, one address to receive bills, another for shipping, a third for postal deliveries, and a separate street address. Each address has a different location number. The primary location—indicated by a 1—is the address you use most often and may be different from the main address.

logistical task  In PeopleSoft Enterprise Services Procurement, an administrative task that is related to hiring a service provider. Logistical tasks are linked to the service type on the work order so that different types of services can have different logistical tasks. Logistical tasks include both preapproval tasks (such as assigning a new badge or ordering a new laptop) and postapproval tasks (such as scheduling orientation or setting up the service provider email). The logistical tasks can be mandatory or optional. Mandatory preapproval tasks must be completed before the work order is approved. Mandatory postapproval tasks, on the other hand, must be completed before a work order is released to a service provider.

market template  In PeopleSoft Enterprise Incentive Management, additional functionality that is specific to a given market or industry and is built on top of a product category.

mass change  In PeopleSoft Enterprise Campus Solutions, mass change is a SQL generator that can be used to create specialized functionality. Using mass change, you can set up a series of Insert, Update, or Delete SQL statements to perform business functions that are specific to the institution.

See also 3C engine.

match group  In PeopleSoft Enterprise Receivables, a group of receivables items and matching offset items. The system creates match groups by using user-defined matching criteria for selected field values.

MCF server  Abbreviation for PeopleSoft MultiChannel Framework server. Comprises the universal queue server and the MCF log server. Both processes are started when MCF Servers is selected in an application server domain configuration.

merchandising activity  In PeopleSoft Enterprise Promotions Management, a specific discount type that is associated with a trade promotion (such as off-invoice, billback or rebate, or lump-sum payment) that defines the performance that is required to receive the discount. In the industry, you may know this as an offer, a discount, a merchandising event, an event, or a tactic.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>meta-SQL</strong></td>
<td>Meta-SQL constructs expand into platform-specific SQL substrings. They are used in functions that pass SQL strings, such as in SQL objects, the SQLExec function, and PeopleSoft Application Engine programs.</td>
</tr>
<tr>
<td><strong>metastring</strong></td>
<td>Metastrings are special expressions included in SQL string literals. The metastrings, prefixed with a percent (%) symbol, are included directly in the string literals. They expand at run time into an appropriate substring for the current database platform.</td>
</tr>
<tr>
<td><strong>multibook</strong></td>
<td>In PeopleSoft Enterprise General Ledger, multiple ledgers having multiple-base currencies that are defined for a business unit, with the option to post a single transaction to all base currencies (all ledgers) or to only one of those base currencies (ledgers).</td>
</tr>
<tr>
<td><strong>multicurrency</strong></td>
<td>The ability to process transactions in a currency other than the business unit’s base currency.</td>
</tr>
<tr>
<td><strong>national allowance</strong></td>
<td>In PeopleSoft Enterprise Promotions Management, a promotion at the corporate level that is funded by nondiscretionary dollars. In the industry, you may know this as a national promotion, a corporate promotion, or a corporate discount.</td>
</tr>
<tr>
<td><strong>NDP</strong></td>
<td>Abbreviation for Non-Discountable Products. Term used for products or groups of products where the selling price cannot be decreased.</td>
</tr>
<tr>
<td><strong>need</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, the difference between the cost of attendance (COA) and the expected family contribution (EFC). It is the gap between the cost of attending the school and the student’s resources. The financial aid package is based on the amount of financial need. The process of determining a student’s need is called need analysis.</td>
</tr>
<tr>
<td><strong>node-oriented tree</strong></td>
<td>A tree that is based on a detail structure, but the detail values are not used.</td>
</tr>
<tr>
<td><strong>Optimization Engine</strong></td>
<td>A PeopleTools component that Strategic Sourcing leverages to evaluate bids and determine an ideal award allocation. The award recommendation is based on maximizing the value while adhering to purchasing and company objectives and constraints.</td>
</tr>
<tr>
<td><strong>pagelet</strong></td>
<td>Each block of content on the home page is called a pagelet. These pagelets display summary information within a small rectangular area on the page. The pagelet provide users with a snapshot of their most relevant PeopleSoft Enterprise and non-PeopleSoft Enterprise content.</td>
</tr>
<tr>
<td><strong>participant</strong></td>
<td>In PeopleSoft Enterprise Incentive Management, participants are recipients of the incentive compensation calculation process.</td>
</tr>
<tr>
<td><strong>participant object</strong></td>
<td>Each participant object may be related to one or more compensation objects.</td>
</tr>
<tr>
<td><strong>partner</strong></td>
<td>A company that supplies products or services that are resold or purchased by the enterprise.</td>
</tr>
<tr>
<td><strong>pay cycle</strong></td>
<td>In PeopleSoft Enterprise Payables, a set of rules that define the criteria by which it should select scheduled payments for payment creation.</td>
</tr>
<tr>
<td><strong>payment shuffle</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, a process allowing payments that have been previously posted to a student’s account to be automatically reapplied when a higher priority payment is posted or the payment allocation definition is changed.</td>
</tr>
<tr>
<td><strong>pending item</strong></td>
<td>In PeopleSoft Enterprise Receivables, an individual receivable (such as an invoice, a credit memo, or a write-off) that has been entered in or created by the system, but hasn’t been posted.</td>
</tr>
<tr>
<td><strong>PeopleCode</strong></td>
<td>PeopleCode is a proprietary language, executed by the PeopleSoft Enterprise component processor. PeopleCode generates results based on existing data or user actions. By using various tools provided with PeopleTools, external services are available to all PeopleSoft Enterprise applications wherever PeopleCode can be executed.</td>
</tr>
<tr>
<td><strong>PeopleCode event</strong></td>
<td>See event.</td>
</tr>
<tr>
<td><strong>PeopleSoft Pure Internet Architecture</strong></td>
<td>The fundamental architecture on which PeopleSoft 8 applications are constructed, consisting of a relational database management system (RDBMS), an application server, a web server, and a browser.</td>
</tr>
<tr>
<td><strong>performance measurement</strong></td>
<td>In PeopleSoft Enterprise Incentive Management, a variable used to store data (similar to an aggregator, but without a predefined formula) within the scope of an incentive plan. Performance measures are associated with a plan calendar, territory, and participant. Performance measurements are used for quota calculation and reporting.</td>
</tr>
<tr>
<td><strong>period context</strong></td>
<td>In PeopleSoft Enterprise Incentive Management, because a participant typically uses the same compensation plan for multiple periods, the period context associates a plan context with a specific calendar period and fiscal year. The period context references the associated plan context, thus forming a chain. Each plan context has a corresponding set of period contexts.</td>
</tr>
<tr>
<td><strong>person of interest</strong></td>
<td>A person about whom the organization maintains information but who is not part of the workforce.</td>
</tr>
<tr>
<td><strong>personal portfolio</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, the user-accessible menu item that contains an individual’s name, address, telephone number, and other personal information.</td>
</tr>
<tr>
<td><strong>phase</strong></td>
<td>A level 1 task, meaning that if a task had subtasks, the level 1 task would be considered the phase.</td>
</tr>
<tr>
<td><strong>pickup quantity</strong></td>
<td>The product quantity that the customer is taking with them from the counter sales environment.</td>
</tr>
<tr>
<td><strong>plan</strong></td>
<td>In PeopleSoft Enterprise Sales Incentive Management, a collection of allocation rules, variables, steps, sections, and incentive rules that instruct the PeopleSoft Enterprise Incentive Management engine in how to process transactions.</td>
</tr>
<tr>
<td><strong>plan context</strong></td>
<td>In PeopleSoft Enterprise Incentive Management, correlates a participant with the compensation plan and node to which the participant is assigned, enabling the PeopleSoft Enterprise Incentive Management system to find anything that is associated with the node and that is required to perform compensation processing. Each participant, node, and plan combination represents a unique plan context—if three participants are on a compensation structure, each has a different plan context. Configuration plans are identified by plan contexts and are associated with the participants that refer to them.</td>
</tr>
<tr>
<td><strong>plan template</strong></td>
<td>In PeopleSoft Enterprise Incentive Management, the base from which a plan is created. A plan template contains common sections and variables that are inherited by all plans that are created from the template. A template may contain steps and sections that are not visible in the plan definition.</td>
</tr>
<tr>
<td><strong>planned learning</strong></td>
<td>In PeopleSoft Enterprise Learning Management, a self-service repository for all of a learner’s planned learning activities and programs.</td>
</tr>
<tr>
<td><strong>planning instance</strong></td>
<td>In PeopleSoft Enterprise Supply Planning, a set of data (business units, items, supplies, and demands) constituting the inputs and outputs of a supply plan.</td>
</tr>
</tbody>
</table>
| **population** | In PeopleSoft Enterprise Campus Solutions, the middle level of the three-level classification structure that you define in PeopleSoft Enterprise Recruiting and
Admissions for enrollment management. You can define a population level, link it to other levels, and set enrollment target numbers for it.

See also division and cohort.

**portal registry**

In PeopleSoft Enterprise applications, the portal registry is a tree-like structure in which content references are organized, classified, and registered. It is a central repository that defines both the structure and content of a portal through a hierarchical, tree-like structure of folders useful for organizing and securing content references.

**predecessor task**

A task that you must complete before you start another task.

**price breaks**

In PeopleSoft Strategic Sourcing, a price discount or surcharge that a bidder may apply based on the quantity awarded.

**price components**

In PeopleSoft Strategic Sourcing, the various components, such as material costs, labor costs, shipping costs, and so on that make up the overall bid price.

**price list**

Enables you to select products and conditions for which the price list applies to a transaction. During a transaction, the system either determines the product price based on the predefined search hierarchy for the transaction or uses the product’s lowest price on any associated, active price lists. This price is used as the basis for any further discounts and surcharges.

**price rule**

The conditions that must be met for adjustments to be applied to the base price. Multiple rules can apply when conditions of each rule are met.

**price rule conditions**

Conditions that select the price-by fields, the values for the price-by fields, and the operator that determines how the price-by fields relate to the transaction.

**price rule key**

The fields that are available to define price rule conditions (which are used to match a transaction) on the price rule.

**primacy number**

In PeopleSoft Enterprise Campus Solutions, a number that the system uses to prioritize financial aid applications when students are enrolled in multiple academic careers and academic programs at the same time. The Consolidate Academic Statistics process uses the primacy number indicated for both the career and program at the institutional level to determine a student’s primary career and program. The system also uses the number to determine the primary student attribute value that is used when you extract data to report on cohorts. The lowest number takes precedence.

**primary name type**

In PeopleSoft Enterprise Campus Solutions, the name type that is used to link the name stored at the highest level within the system to the lower-level set of names that an individual provides.

**process category**

In PeopleSoft Process Scheduler, processes that are grouped for server load balancing and prioritization.

**process group**

In PeopleSoft Enterprise Financials, a group of application processes (performed in a defined order) that users can initiate in real time, directly from a transaction entry page.

**process definition**

Process definitions define each run request.

**process instance**

A unique number that identifies each process request. This value is automatically incremented and assigned to each requested process when the process is submitted to run.

**process job**

You can link process definitions into a job request and process each request serially or in parallel. You can also initiate subsequent processes based on the return code from each prior request.
**process request**  
A single run request, such as a Structured Query Report (SQR), a COBOL or Application Engine program, or a Crystal report that you run through PeopleSoft Process Scheduler.

**process run control**  
A PeopleTools variable used to retain PeopleSoft Process Scheduler values needed at runtime for all requests that reference a run control ID. Do not confuse these with application run controls, which may be defined with the same run control ID, but only contain information specific to a given application process request.

**product**  
A PeopleSoft Enterprise or third-party product. PeopleSoft organizes its software products into product families and product lines. Interactive Services Repository contains information about every release of every product that PeopleSoft sells, as well as products from certified third-party companies. These products appear with the product name and release number.

**product adds**  
The pricing functionality where buying product A gets product B for free or at a price (formerly referred to as giveaways).

**product bidding**  
In PeopleSoft Strategic Sourcing, the placing of a bid on behalf of the bidder, up or down to the bidder’s specified amount, so that the bidder can be the leading bidder.

**product category**  
In PeopleSoft Enterprise Incentive Management, indicates an application in the PeopleSoft Enterprise Incentive Management suite of products. Each transaction in the PeopleSoft Enterprise Incentive Management system is associated with a product category.

**product family**  
A group of products that are related by common functionality. The family names that can be searched using Interactive Service Repository are Oracle’s PeopleSoft Enterprise, PeopleSoft EnterpriseOne, PeopleSoft World, and third-party, certified partners.

**product line**  
The name of a PeopleSoft Enterprise product line or the company name of a third-party certified partner. Integration Services Repository enables you to search for integration points by product line.

**programs**  
In PeopleSoft Enterprise Learning Management, a high-level grouping that guides the learner along a specific learning path through sections of catalog items. PeopleSoft Enterprise Learning Systems provides two types of programs—curricula and certifications.

**progress log**  
In PeopleSoft Enterprise Services Procurement, tracks deliverable-based projects. This is similar to the time sheet in function and process. The service provider contact uses the progress log to record and submit progress on deliverables. The progress can be logged by the activity that is performed, by the percentage of work that is completed, or by the completion of milestone activities that are defined for the project.

**project transaction**  
In PeopleSoft Enterprise Project Costing, an individual transaction line that represents a cost, time, budget, or other transaction row.

**promotion**  
In PeopleSoft Enterprise Promotions Management, a trade promotion, which is typically funded from trade dollars and used by consumer products manufacturers to increase sales volume.

**prospects**  
In PeopleSoft Enterprise Campus Solutions, students who are interested in applying to the institution. In PeopleSoft Enterprise Contributor Relations, individuals and organizations that are most likely to make substantial financial commitments or other types of commitments to the institution.

**proxy bidding**  
In PeopleSoft Strategic Sourcing, the placing of a bid on behalf of the bidder, up or down to the bidder’s specified amount, so that the bidder can be the leading bidder.
<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>publishing</td>
<td>In PeopleSoft Enterprise Incentive Management, a stage in processing that makes incentive-related results available to participants.</td>
</tr>
<tr>
<td>rating components</td>
<td>In PeopleSoft Enterprise Campus Solutions, variables used with the Equation Editor to retrieve specified populations.</td>
</tr>
<tr>
<td>record group</td>
<td>A set of logically and functionally related control tables and views. Record groups help enable TableSet sharing, which eliminates redundant data entry. Record groups ensure that TableSet sharing is applied consistently across all related tables and views.</td>
</tr>
<tr>
<td>record input VAT flag</td>
<td>Abbreviation for record input value-added tax flag. Within PeopleSoft Enterprise Purchasing, Payables, and General Ledger, this flag indicates that you are recording input VAT on the transaction. This flag, in conjunction with the record output VAT flag, is used to determine the accounting entries created for a transaction and to determine how a transaction is reported on the VAT return. For all cases within Purchasing and Payables where VAT information is tracked on a transaction, this flag is set to Yes. This flag is not used in PeopleSoft Enterprise Order Management, Billing, or Receivables, where it is assumed that you are always recording only output VAT, or in PeopleSoft Enterprise Expenses, where it is assumed that you are always recording only input VAT.</td>
</tr>
<tr>
<td>record output VAT flag</td>
<td>Abbreviation for record output value-added tax flag. See record input VAT flag.</td>
</tr>
<tr>
<td>recname</td>
<td>The name of a record that is used to determine the associated field to match a value or set of values.</td>
</tr>
<tr>
<td>recognition</td>
<td>In PeopleSoft Enterprise Campus Solutions, the recognition type indicates whether the PeopleSoft Enterprise Contributor Relations donor is the primary donor of a commitment or shares the credit for a donation. Primary donors receive hard credit that must total 100 percent. Donors that share the credit are given soft credit. Institutions can also define other share recognition-type values such as memo credit or vehicle credit.</td>
</tr>
<tr>
<td>reference data</td>
<td>In PeopleSoft Enterprise Sales Incentive Management, system objects that represent the sales organization, such as territories, participants, products, customers, and channels.</td>
</tr>
<tr>
<td>reference object</td>
<td>In PeopleSoft Enterprise Incentive Management, this dimension-type object further defines the business. Reference objects can have their own hierarchy (for example, product tree, customer tree, industry tree, and geography tree).</td>
</tr>
<tr>
<td>reference transaction</td>
<td>In commitment control, a reference transaction is a source transaction that is referenced by a higher-level (and usually later) source transaction, in order to automatically reverse all or part of the referenced transaction’s budget-checked amount. This avoids duplicate postings during the sequential entry of the transaction at different commitment levels. For example, the amount of an encumbrance transaction (such as a purchase order) will, when checked and recorded against a budget, cause the system to concurrently reference and relieve all or part of the amount of a corresponding pre-encumbrance transaction, such as a purchase requisition.</td>
</tr>
<tr>
<td>regional sourcing</td>
<td>In PeopleSoft Enterprise Purchasing, provides the infrastructure to maintain, display, and select an appropriate vendor and vendor pricing structure that is based on a regional sourcing model where the multiple ship to locations are grouped. Sourcing may occur at a level higher than the ship to location.</td>
</tr>
<tr>
<td>relationship object</td>
<td>In PeopleSoft Enterprise Incentive Management, these objects further define a compensation structure to resolve transactions by establishing associations between compensation objects and business objects.</td>
</tr>
<tr>
<td>remote data source data</td>
<td>Data that is extracted from a separate database and migrated into the local database.</td>
</tr>
<tr>
<td><strong>Glossary</strong></td>
<td></td>
</tr>
<tr>
<td>-------------</td>
<td></td>
</tr>
<tr>
<td><strong>REN server</strong></td>
<td>Abbreviation for <em>real-time event notification server</em> in PeopleSoft MultiChannel Framework.</td>
</tr>
<tr>
<td><strong>requester</strong></td>
<td>In PeopleSoft Enterprise eSettlements, an individual who requests goods or services and whose ID appears on the various procurement pages that reference purchase orders.</td>
</tr>
<tr>
<td><strong>reservations</strong></td>
<td>In PeopleSoft Expenses, travel reservations that have been placed with the travel vendor.</td>
</tr>
<tr>
<td><strong>reversal indicator</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, an indicator that denotes when a particular payment has been reversed, usually because of insufficient funds.</td>
</tr>
<tr>
<td><strong>RFI event</strong></td>
<td>In PeopleSoft Strategic Sourcing, a request for information.</td>
</tr>
<tr>
<td><strong>RFx event</strong></td>
<td>In PeopleSoft Strategic Sourcing, a request for proposal or request for a quote event when bidders submit their overall best bids and during which bidders do not actively compete against one another.</td>
</tr>
<tr>
<td><strong>role</strong></td>
<td>Describes how people fit into PeopleSoft Workflow. A role is a class of users who perform the same type of work, such as clerks or managers. Your business rules typically specify what user role needs to do an activity.</td>
</tr>
<tr>
<td><strong>role user</strong></td>
<td>A PeopleSoft Workflow user. A person’s role user ID serves much the same purpose as a user ID does in other parts of the system. PeopleSoft Workflow uses role user IDs to determine how to route worklist items to users (through an email address, for example) and to track the roles that users play in the workflow. Role users do not need PeopleSoft user IDs.</td>
</tr>
<tr>
<td><strong>roll up</strong></td>
<td>In a tree, to roll up is to total sums based on the information hierarchy.</td>
</tr>
<tr>
<td><strong>run control</strong></td>
<td>A run control is a type of online page that is used to begin a process, such as the batch processing of a payroll run. Run control pages generally start a program that manipulates data.</td>
</tr>
<tr>
<td><strong>run control ID</strong></td>
<td>A unique ID to associate each user with his or her own run control table entries.</td>
</tr>
<tr>
<td><strong>run-level context</strong></td>
<td>In PeopleSoft Enterprise Incentive Management, associates a particular run (and batch ID) with a period context and plan context. Every plan context that participates in a run has a separate run-level context. Because a run cannot span periods, only one run-level context is associated with each plan context.</td>
</tr>
<tr>
<td><strong>saved bid</strong></td>
<td>In PeopleSoft Strategic Sourcing, a bid that has been created but not submitted. Only submitted bids are eligible for award.</td>
</tr>
<tr>
<td><strong>score</strong></td>
<td>In PeopleSoft Strategic Sourcing, the numerical sum of answers (percentages) to bid factors on an event. Scores appear only to bidders on auction events.</td>
</tr>
<tr>
<td><strong>SCP SCBM XML message</strong></td>
<td>Abbreviation for <em>Supply Chain Planning Supply Chain Business Modeler Extensible Markup Language message</em>. Supply Chain Business Modeler uses XML as the format for all data that it imports and exports.</td>
</tr>
<tr>
<td><strong>search query</strong></td>
<td>You use this set of objects to pass a query string and operators to the search engine. The search index returns a set of matching results with keys to the source documents.</td>
</tr>
<tr>
<td><strong>search/match</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions and PeopleSoft Enterprise Human Resources Management Solutions, a feature that enables you to search for and identify duplicate records in the database.</td>
</tr>
<tr>
<td><strong>seasonal address</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, an address that recurs for the same length of time at the same time of year each year until adjusted or deleted.</td>
</tr>
</tbody>
</table>
section
In PeopleSoft Enterprise Incentive Management, a collection of incentive rules that operate on transactions of a specific type. Sections enable plans to be segmented to process logical events in different sections.

security event
In commitment control, security events trigger security authorization checking, such as budget entries, transfers, and adjustments; exception overrides and notifications; and inquiries.

sell event
In PeopleSoft Strategic Sourcing, for event creators, the sale of goods or services most typically associated with forward auctions. For bidders, the purchase of goods or services.

serial genealogy
In PeopleSoft Enterprise Manufacturing, the ability to track the composition of a specific, serial-controlled item.

serial in production
In PeopleSoft Enterprise Manufacturing, enables the tracing of serial information for manufactured items. This is maintained in the Item Master record.

service impact
In PeopleSoft Enterprise Campus Solutions, the resulting action triggered by a service indicator. For example, a service indicator that reflects nonpayment of account balances by a student might result in a service impact that prohibits registration for classes.

service indicator
In PeopleSoft Enterprise Campus Solutions, indicates services that may be either withheld or provided to an individual. Negative service indicators indicate holds that prevent the individual from receiving specified services, such as check-cashing privileges or registration for classes. Positive service indicators designate special services that are provided to the individual, such as front-of-line service or special services for disabled students.

session
In PeopleSoft Enterprise Campus Solutions, time elements that subdivide a term into multiple time periods during which classes are offered. In PeopleSoft Enterprise Contributor Relations, a session is the means of validating gift, pledge, membership, or adjustment data entry. It controls access to the data entered by a specific user ID. Sessions are balanced, queued, and then posted to the institution’s financial system. Sessions must be posted to enter a matching gift or pledge payment, to make an adjustment, or to process giving clubs or acknowledgements.

In PeopleSoft Enterprise Learning Management, a single meeting day of an activity (that is, the period of time between start and finish times within a day). The session stores the specific date, location, meeting time, and instructor. Sessions are used for scheduled training.

session template
In PeopleSoft Enterprise Learning Management, enables you to set up common activity characteristics that may be reused while scheduling a PeopleSoft Enterprise Learning Management activity—characteristics such as days of the week, start and end times, facility and room assignments, instructors, and equipment. A session pattern template can be attached to an activity that is being scheduled. Attaching a template to an activity causes all of the default template information to populate the activity session pattern.

setup relationship
In PeopleSoft Enterprise Incentive Management, a relationship object type that associates a configuration plan with any structure node.

share driver expression
In PeopleSoft Enterprise Business Planning, a named planning method similar to a driver expression, but which you can set up globally for shared use within a single planning application or to be shared between multiple planning applications through PeopleSoft Enterprise Warehouse.

short-term customer
A customer not in the system who is entered during sales order entry using a template.
<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>single signon</td>
<td>With single signon, users can, after being authenticated by a PeopleSoft Enterprise application server, access a second PeopleSoft Enterprise application server without entering a user ID or password.</td>
</tr>
<tr>
<td>source key process</td>
<td>In PeopleSoft Enterprise Campus Solutions, a process that relates a particular transaction to the source of the charge or financial aid. On selected pages, you can drill down into particular charges.</td>
</tr>
<tr>
<td>source transaction</td>
<td>In commitment control, any transaction generated in a PeopleSoft Enterprise or third-party application that is integrated with commitment control and which can be checked against commitment control budgets. For example, a pre-encumbrance, encumbrance, expenditure, recognized revenue, or collected revenue transaction.</td>
</tr>
<tr>
<td>sourcing objective</td>
<td>For constraints, the option to designate whether a business rule is required (mandatory) or is only recommended (target).</td>
</tr>
<tr>
<td>speed key</td>
<td>See communication key.</td>
</tr>
<tr>
<td>SpeedChart</td>
<td>A user-defined shorthand key that designates several ChartKeys to be used for voucher entry. Percentages can optionally be related to each ChartKey in a SpeedChart definition.</td>
</tr>
<tr>
<td>SpeedType</td>
<td>A code representing a combination of ChartField values. SpeedTypes simplify the entry of ChartFields commonly used together.</td>
</tr>
<tr>
<td>staging</td>
<td>A method of consolidating selected partner offerings with the offerings from the enterprise’s other partners.</td>
</tr>
<tr>
<td>standard letter code</td>
<td>In PeopleSoft Enterprise Campus Solutions, a standard letter code used to identify each letter template available for use in mail merge functions. Every letter generated in the system must have a standard letter code identification.</td>
</tr>
<tr>
<td>statutory account</td>
<td>Account required by a regulatory authority for recording and reporting financial results. In PeopleSoft Enterprise, this is equivalent to the Alternate Account (ALTACCT) ChartField.</td>
</tr>
<tr>
<td>step</td>
<td>In PeopleSoft Enterprise Sales Incentive Management, a collection of sections in a plan. Each step corresponds to a step in the job run.</td>
</tr>
<tr>
<td>storage level</td>
<td>In PeopleSoft Enterprise Inventory, identifies the level of a material storage location. Material storage locations are made up of a business unit, a storage area, and a storage level. You can set up to four storage levels.</td>
</tr>
<tr>
<td>subcustomer qualifier</td>
<td>A value that groups customers into a division for which you can generate detailed history, aging, events, and profiles.</td>
</tr>
<tr>
<td>Summary ChartField</td>
<td>You use summary ChartFields to create summary ledgers that roll up detail amounts based on specific detail values or on selected tree nodes. When detail values are summarized using tree nodes, summary ChartFields must be used in the summary ledger data record to accommodate the maximum length of a node name (20 characters).</td>
</tr>
<tr>
<td>summary ledger</td>
<td>An accounting feature used primarily in allocations, inquiries, and PS/nVision reporting to store combined account balances from detail ledgers. Summary ledgers increase speed and efficiency of reporting by eliminating the need to summarize detail ledger balances each time a report is requested. Instead, detail balances are summarized in a background process according to user-specified criteria and stored on summary ledgers. The summary ledgers are then accessed directly for reporting.</td>
</tr>
<tr>
<td>summary time period</td>
<td>In PeopleSoft Enterprise Business Planning, any time period (other than a base time period) that is an aggregate of other time periods, including other summary time periods and base time periods, such as quarter and year total.</td>
</tr>
<tr>
<td><strong>Glossary</strong></td>
<td></td>
</tr>
<tr>
<td>----------------</td>
<td></td>
</tr>
<tr>
<td><strong>summary tree</strong></td>
<td>A tree used to roll up accounts for each type of report in summary ledgers. Summary trees enable you to define trees on trees. In a summary tree, the detail values are really nodes on a detail tree or another summary tree (known as the basis tree). A summary tree structure specifies the details on which the summary trees are to be built.</td>
</tr>
<tr>
<td><strong>syndicate</strong></td>
<td>To distribute a production version of the enterprise catalog to partners.</td>
</tr>
<tr>
<td><strong>system function</strong></td>
<td>In PeopleSoft Enterprise Receivables, an activity that defines how the system generates accounting entries for the general ledger.</td>
</tr>
<tr>
<td><strong>system source</strong></td>
<td>The system source identifies the source of a transaction row in the database. For example, a transaction that originates in PeopleSoft Enterprise Expenses contains a system source code of BEX (Expenses Batch). When PeopleSoft Enterprise Project Costing prices the source transaction row for billing, the system creates a new row with a system source code of PRP (Project Costing pricing), which represents the system source of the new row. System source codes can identify sources that are internal or external to the PeopleSoft Enterprise system. For example, processes that import data from Microsoft Project into PeopleSoft Enterprise applications create transaction rows with a source code of MSP (Microsoft Project).</td>
</tr>
<tr>
<td><strong>TableSet</strong></td>
<td>A means of sharing similar sets of values in control tables, where the actual data values are different but the structure of the tables is the same.</td>
</tr>
<tr>
<td><strong>TableSet sharing</strong></td>
<td>Shared data that is stored in many tables that are based on the same TableSets. Tables that use TableSet sharing contain the SETID field as an additional key or unique identifier.</td>
</tr>
<tr>
<td><strong>target currency</strong></td>
<td>The value of the entry currency or currencies converted to a single currency for budget viewing and inquiry purposes.</td>
</tr>
<tr>
<td><strong>task</strong></td>
<td>A deliverable item on the detailed sourcing plan.</td>
</tr>
<tr>
<td><strong>tax authority</strong></td>
<td>In PeopleSoft Enterprise Campus Solutions, a user-defined element that combines a description and percentage of a tax with an account type, an item type, and a service impact.</td>
</tr>
<tr>
<td><strong>template</strong></td>
<td>A template is HTML code associated with a web page. It defines the layout of the page and also where to get HTML for each part of the page. In PeopleSoft Enterprise, you use templates to build a page by combining HTML from a number of sources. For a PeopleSoft Enterprise portal, all templates must be registered in the portal registry, and each content reference must be assigned a template.</td>
</tr>
<tr>
<td><strong>tenant</strong></td>
<td>In PeopleSoft Real Estate Management, an entity that leases real estate from a landlord.</td>
</tr>
<tr>
<td><strong>territory</strong></td>
<td>In PeopleSoft Enterprise Sales Incentive Management, hierarchical relationships of business objects, including regions, products, customers, industries, and participants.</td>
</tr>
<tr>
<td><strong>third party</strong></td>
<td>A company or vendor that has extensive PeopleSoft Enterprise product knowledge and whose products and integrations have been certified and are compatible with PeopleSoft Enterprise applications.</td>
</tr>
<tr>
<td><strong>tiered pricing</strong></td>
<td>Enables different portions of a schedule to be priced differently from one another.</td>
</tr>
<tr>
<td><strong>time span</strong></td>
<td>A relative period, such as year-to-date or current period, that various PeopleSoft General Ledger functions and reports can use when a rolling time frame, rather than a specific date, is required.</td>
</tr>
<tr>
<td><strong>total cost</strong></td>
<td>In PeopleSoft Strategic Sourcing, the estimated dollar cost (sum of real price dollars and potential “soft” or non-price dollars) of a particular award approach.</td>
</tr>
</tbody>
</table>
travel group
In PeopleSoft Expenses, the organization’s travel rules and policies that are associated with specific business units, departments, or employees. You must define at least one travel group when setting up the PeopleSoft Expenses travel feature. You must define and associate at least one travel group with a travel vendor.

travel partner
In PeopleSoft Expenses, the travel vendor with which the organization has a contractual relationship.

3C engine
Abbreviation for Communications, Checklists, and Comments engine. In PeopleSoft Enterprise Campus Solutions, the 3C engine enables you to automate business processes that involve additions, deletions, and updates to communications, checklists, and comments. You define events and triggers to engage the engine, which runs the mass change and processes the 3C records (for individuals or organizations) immediately and automatically from within business processes.

3C group
Abbreviation for Communications, Checklists, and Comments group. In PeopleSoft Enterprise Campus Solutions, a method of assigning or restricting access privileges. A 3C group enables you to group specific communication categories, checklist codes, and comment categories. You can then assign the group inquiry-only access or update access, as appropriate.

trace usage
In PeopleSoft Enterprise Manufacturing, enables the control of which components will be traced during the manufacturing process. Serial- and lot-controlled components can be traced. This is maintained in the Item Master record.

transaction allocation
In PeopleSoft Enterprise Incentive Management, the process of identifying the owner of a transaction. When a raw transaction from a batch is allocated to a plan context, the transaction is duplicated in the PeopleSoft Enterprise Incentive Management transaction tables.

transaction state
In PeopleSoft Enterprise Incentive Management, a value assigned by an incentive rule to a transaction. Transaction states enable sections to process only transactions that are at a specific stage in system processing. After being successfully processed, transactions may be promoted to the next transaction state and “picked up” by a different section for further processing.

Translate table
A system edit table that stores codes and translate values for the miscellaneous fields in the database that do not warrant individual edit tables of their own.

tree
The graphical hierarchy in PeopleSoft Enterprise systems that displays the relationship between all accounting units (for example, corporate divisions, projects, reporting groups, account numbers) and determines roll-up hierarchies.

tuition lock
In PeopleSoft Enterprise Campus Solutions, a feature in the Tuition Calculation process that enables you to specify a point in a term after which students are charged a minimum (or locked) fee amount. Students are charged the locked fee amount even if they later drop classes and take less than the normal load level for that tuition charge.

unclaimed transaction
In PeopleSoft Enterprise Incentive Management, a transaction that is not claimed by a node or participant after the allocation process has completed, usually due to missing or incomplete data. Unclaimed transactions may be manually assigned to the appropriate node or participant by a compensation administrator.

universal navigation header
Every PeopleSoft Enterprise portal includes the universal navigation header, intended to appear at the top of every page as long as the user is signed on to the portal. In addition to providing access to the standard navigation buttons (like Home, Favorites, and signoff) the universal navigation header can also display a welcome message for each user.

update access
In PeopleSoft Enterprise Campus Solutions, a type of security access that permits the user to edit and update data.
Glossary

See also inquiry access.

**user interaction object**
In PeopleSoft Enterprise Sales Incentive Management, used to define the reporting components and reports that a participant can access in his or her context. All PeopleSoft Enterprise Sales Incentive Management user interface objects and reports are registered as user interaction objects. User interaction objects can be linked to a compensation structure node through a compensation relationship object (individually or as groups).

**variable**
In PeopleSoft Enterprise Sales Incentive Management, the intermediate results of calculations. Variables hold the calculation results and are then inputs to other calculations. Variables can be plan variables that persist beyond the run of an engine or local variables that exist only during the processing of a section.

**VAT exception**
Abbreviation for value-added tax exception. A temporary or permanent exemption from paying VAT that is granted to an organization. This term refers to both VAT exoneration and VAT suspension.

**VAT exempt**
Abbreviation for value-added tax exempt. Describes goods and services that are not subject to VAT. Organizations that supply exempt goods or services are unable to recover the related input VAT. This is also referred to as exempt without recovery.

**VAT exoneration**
Abbreviation for value-added tax exoneration. An organization that has been granted a permanent exemption from paying VAT due to the nature of that organization.

**VAT suspension**
Abbreviation for value-added tax suspension. An organization that has been granted a temporary exemption from paying VAT.

**warehouse**
A PeopleSoft Enterprise data warehouse that consists of predefined ETL maps, data warehouse tools, and DataMart definitions.

**weight or weighing**
In PeopleSoft Strategic Sourcing, how important the line or question is to the overall event. Weighting is used to score and analyze bids. For RFx and RFI events, weightings may or may not appear to bidders.

**work order**
In PeopleSoft Enterprise Services Procurement, enables an enterprise to create resource-based and deliverable-based transactions that specify the basic terms and conditions for hiring a specific service provider. When a service provider is hired, the service provider logs time or progress against the work order.

**worker**
A person who is part of the workforce; an employee or a contingent worker.

**workset**
A group of people and organizations that are linked together as a set. You can use worksets to simultaneously retrieve the data for a group of people and organizations and work with the information on a single page.

**worksheet**
A way of presenting data through a PeopleSoft Enterprise Business Analysis Modeler interface that enables users to do in-depth analysis using pivoting tables, charts, notes, and history information.

**worklist**
The automated to-do list that PeopleSoft Workflow creates. From the worklist, you can directly access the pages you need to perform the next action, and then return to the worklist for another item.

**XML link**
The XML Linking language enables you to insert elements into XML documents to create a links between resources.

**XML schema**
An XML definition that standardizes the representation of application messages, component interfaces, or business interlinks.

**XPI**
Abbreviation for eXtended Process Integrator. PeopleSoft XPI is the integration infrastructure that enables both real-time and batch communication with JD Edwards EnterpriseOne applications.
**yield by operation**

In PeopleSoft Enterprise Manufacturing, the ability to plan the loss of a manufactured item on an operation-by-operation basis.

**zero-rated VAT**

Abbreviation for *zero-rated value-added tax*. A VAT transaction with a VAT code that has a tax percent of zero. Used to track taxable VAT activity where no actual VAT amount is charged. Organizations that supply zero-rated goods and services can still recover the related input VAT. This is also referred to as exempt with recovery.
