Formulation and Execution of a Federal Civilian Agency’s Budget with Oracle Hyperion Public Sector Planning and Budgeting
Disclaimer

The following is intended to outline our general product direction. It is intended for information purposes only, and may not be incorporated into any contract. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, and timing of any features or functionality described for Oracle’s products remains at the sole discretion of Oracle.
A Powerful Tool for Federal Budgeting

Oracle Hyperion Public Sector Planning and Budgeting (Hyperion PSPB) provides a commercial off-the-shelf (COTS) solution for Federal Agencies to formulate their budgets and accomplish the many tasks required for budget execution.

Leveraging the multidimensional power of Oracle Essbase, the Budget Office, Program Managers, Organization Managers and Budget Analysts can use the planning, forecasting and reporting capabilities of Hyperion PSPB to improve accuracy and eliminate the need to create and manage the numerous Microsoft Excel spreadsheets normally used in the budgeting process.

Budget preparation and analysis can be done using personalized web data entry forms or Microsoft Excel forms that leverage Oracle’s Microsoft Office plug-in called Oracle Hyperion Smart View for Office. This provides the end user full Microsoft Excel functionality but using a secure centralized database. Multiple staff can work on different parts of the same budget simultaneously with built-in security and a wizard to help guide planners. User-defined electronic workflow seamlessly moves budget data throughout an Agency to approvers with notifications and alerts based on defined business rules.

The multi-dimensional capability of Oracle Essbase enables users to view data in as many different ways (dimensions) as desired with a click of a button. There is no need to maintain Microsoft Excel worksheets with multiple tabs to obtain different views of the data for Time Periods, Entities, Object Classes / Accounts, Scenarios, Versions, Fiscal Years, Programs, Funds, etc. Users can change how they view the data with a simple mouse click and ‘drag and drop’ pivoting. This capability enhances the user’s experience particularly when running ad-hoc queries on-line.

Bi-directional integration with source systems is provided for packaged financial and HR systems. Actuals from an Agency’s core financial systems can be uploaded to Hyperion PSPB and allotments developed that can be written back to the general ledger. Users can also upload actual payroll and staff data from their financial and payroll systems into Hyperion PSPB to seed the planning process and to compare plans with actual results.
Web based reports can be developed as can exception reports based on calendar events and routing. Graphical and text reports can be generated in various formats, including HTML, PDF and Microsoft Office (Excel, PowerPoint and Word).
Budget Formulation

An Agency’s Budget Office

An Agency’s Budget Office can develop budget guidance and prepare turn-around Microsoft Excel like templates with thresholds and built-in edits, that also contain prior years’ budgets and actual, for Program and Organizational Managers to complete. Amounts forecasted and computed can be hot linked to supporting text justifications.

Formats for Congressional Budget Book Exhibits including: Amounts Available for Obligation, Summary of Changes, Budget Authority by Activity, Authorizing Legislation, Appropriations History Table, Budget Authority by Object, Salaries and Expenses, Detail of Full-Time Equivalent Employment (FTE), Detail of Positions, budget data by Performance Goals and supplemental budget data can all be developed entirely within Hyperion PSPB. Both the detail and summary level information is all contained within the system rather than in separate disconnected Microsoft Excel spreadsheets.

Electronic Workflow

Hyperion PSPB provides a powerful workflow and plan management framework that supports a range of budgetary processes – from the simple to the very complex including e-mail notifications, alerts, and task lists—that empower users to easily track and communicate the progress of plans and budgets. Approval paths can be specified for each part of the budget, so when the budget is submitted, the system can automatically identify the next approver. Plan promotion paths can be made conditional on meeting certain criteria. For example if the expenditure for travel is budgeted to be more than 5% of the overall budget, the system could require that a certain official approve this plan prior to further progressing it along the normal budget approval chain. All of the above processes can also be performed in conjunction with what-if analysis and scenario testing that allows users to compare and contrast multiple scenarios prior to promoting the selected scenario for approval up the management chain.

Instead of using email with attachments, Program and Organization Managers are notified with alerts that budget guidance has been provided. Managers simply sign in to the system for access and commence work on their funding request. A task list and calendar with due dates can also be included. The Budget Office can also manage all tasks using an overall Agency calendar of due dates and can automatically monitor the completion of tasks. If an Organization is late in providing its schedules and justifications, the system automatically alerts all affected parties.

Preparation of the Congressional Budget Justification (Budget Book)

Hyperion PSPB permits preparation and management of all aspects of the Congressional Budget Justification using Oracle Hyperion Smart View for Office. Formatted textual justifications in Microsoft Word as well as schedules and graphs can all be interleaved on a page and in a single
document with user defined sections and subsections. A table of contents and support for page numbering, bookmarks, start/end pages, chapter start/end pages, graphic/text overlays, cross references and document splitting are provided.

The Budget Book can be output as either a PDF format and/or a deployable HTML web site. Budget Book pages developed throughout the Agency can be consolidated into a single document with version control through content management. Additionally, the Budget Book can be re-used in future years as the basis for a new Budget Book. Hyperion PSPB provides a flexible, secure, centralized, web-based repository that manages all phases of the content life cycle: from creation and approval to publishing, searching, expiration, and archival or disposition.

Together all of these capabilities minimize the time and effort to prepare the Budget Book document and reduce errors, with one additional significant benefit. Since all schedules and graphs in the Budget Book are developed in Hyperion PSPB, when changes are needed, the new amounts/numbers are input to the original planning schedules, controlled by version, and these new amounts/numbers are automatically updated in the schedules and graphs in the Budget Book as well as to any of the amounts/numbers included in the justification paragraphs. There is no need to worry that base line schedules are not in sync with the Congressional Budget Justification.

Office of Management and Budget (OMB) Passback

Hyperion PSPB streamlines the work involved in analyzing the impact of the OMB Passback. Proposed changes can be made to the original schedules in Hyperion PSPB used to formulate the budget request, and the changes automatically flow down to all parts of the budget including the Budget Book. The multi-dimensional capability of Hyperion PSPB enables users to readily see the impact of changes to budget amounts and performance goals as well as the dollar effects of FTE changes and vice versa. Various schedules including Estimates of Budget Authority and Outlays, Object Classification Schedules, Employment Data, etc. for MAX computer data for each budget account are readily available from the system.

Program and Organization Managers

Budgets can be built throughout the Agency from the bottom up and budget justifications can be developed in Microsoft Word with exhibits, schedules and graphs directly incorporated from Hyperion PSPB instead of creating these separately, thereby eliminating potential mistakes and the need to maintain multiple spreadsheets.

Forecasts of salaries and benefits can be developed by individual, position and FTE.

Strategic plans can be developed with goals and associated performance measures.

Performance based budgets can be prepared and tied to the Agency’s strategic plan and the Organization’s portion of the Performance Accountability Report (PAR). What-if scenarios can be readily executed using varying levels of performance metrics and differing goals to see the impact on funds requested and vice versa, an essential capability when applying reduced amounts from a Passback.
Capability to Build an Employee Budgeting Model

One of the unique aspects of Hyperion PSPB is the capability to budget by position, associating existing and to be hired employees to existing and new positions, managing the allocation of various sources of funding to position level budgets and efficiently managing future dated changes.

It supports the import of baseline data from HR systems and an ability to modify this data as part of the budgeting process. In addition, Hyperion PSPB supports a variety of salary and non-salary components of compensation including step based, rate based and value based computations of salary. Moreover, it fully supports future dated changes to position and employee data through a flexible scenario / version methodology that allows for the evaluation of several decision and service packages prior to budget finalization.

Since Hyperion PSPB can link with Agency payroll and HR systems, actual payroll information such as headcount and payroll details can be downloaded to the manager’s plan as a starting point. New staff requested can be fully costed by position and grade. In addition, both common, as well as unique, FTE support costs such as laptops, training, etc. for each position can be applied automatically.

Hyperion PSPB makes headcount, salary, and compensation planning fast and efficient across the entire Organization.

The pre-built functionality and best practices that are ready to use right out of the box, simplifies the planning of workforce and workforce related expenses, such as bonuses, fringe benefits, overtime and merit increases. By automatically and seamlessly linking workforce expense plans, Hyperion PSPB delivers accurate and real-time awareness of the business impact of workforce decisions on the overall expense plans. Working Capital Fund budgets can also be prepared and allocated to servicing components.

Budget Execution

Hyperion PSPB can produce much of the data needed to support preparation of the Standard Form 132, Apportionment and Reapportionment Schedule.

Electronic allotments and allowances for distribution to Program and Organization Managers and uploading to the financial system can be developed. Mid-year adjustments with capability to “Sweep” funds and re-program them with “to” and “from” checks and balances can be accomplished.

Capabilities Available for Program and Organization Managers

Tracking expenses against available funds is a major responsibility of managers throughout an Agency. Hyperion PSPB provides a host of capabilities to assist.

Operating Plans Dashboard

Hyperion PSPB permits managers to develop operating plans by organization, program and object class as well as by month, quarter and even down to the week or day. Actual commitments, obligations
and expenditures can be uploaded from the Agency’s core financial system and compared against operating plans. In addition, since Hyperion PSPB can be linked to the Agency’s financial system, the capability is provided to drill-through to the source detail.

Today, in many Organizations, budget analysts and administrative officers need to continuously reconcile the financial records they maintain on spreadsheets and in other systems with data recorded in their financial system. The Status of Funds reported by Finance, while a useful tool for accountants, does not provide managers with all of the information they need to make fully informed spending decisions. Since this report is based on obligations and expenditures recorded in the Agency’s official ledgers, it does not take into consideration expenditures that a manager plans to make later in the year, or would like to make should funds free up.

Hyperion PSPB can provide a placeholder for these planned expenditures to ensure that these funds are not inadvertently used. Dashboards and reports can be developed to show the information on budgeted, committed, obligated and expended amounts per the Status of Funds from Finance with planned expenditures subtracted to arrive at funds available for managers to use.

Salaries are a significant cost item in most Federal Agencies. Throughout the year, managers can connect to the Agency’s payroll system and forecast payroll costs to ensure that budgeted funds for this object class are in line with expected costs. In addition, capability to do payroll modeling is available.

Summary

Hyperion PSPB for federal budgeting with its multi-dimensional engine, built-in workforce planning, electronic workflow, capability to prepare the “Budget Book,” along with content management and business intelligence integration brings today’s modern technological advances to every facet of the Agency; the Budget Office, Program Managers and Organization Managers. Moreover, since the entire organization can use a single solution with security at all levels, the Agency’s strategic plan and performance accountability reports can all be prepared using these same capabilities and integrated with the Agency’s detailed operational budget.
