Oracle Value Chain Execution

Did you know?
Recent market data places Oracle as the leader in the supply chain execution space.

Benefits of Oracle Value Chain Execution
An integrated suite of logistics applications provides unique benefits. Some benefits Oracle customers have documented are:

- Improved Logistics Efficiency – departing from siloed functional applications to an integrated solution approach improves overall efficiency
- Lower Total Cost of Ownership – having a single vendor and technology framework to manage as well as pre-integrated applications lowers IT costs
- Enhanced Analytics and Visibility – with the entire logistics process managed within a common solution set, organizations gain more meaningful performance metrics and more rapid awareness to operational challenges

Oracle’s supply chain execution applications are collectively referred to as its Value Chain Execution (VCE) suite. The VCE suite supports the entire logistics process in a new and comprehensive manner. Using Oracle’s unique product strategy, this suite of applications bring together market leading capabilities in an open and integrated framework. This strategy allows for easy and flexible implementations which lead to rapid and substantial benefits.

Your supply chain operations and challenges are changing rapidly. Globalization, sustainability initiatives and regulations, seemingly never ending cost cutting pressures…these external challenges need to be balanced with internal operational changes in terms of warehouse openings/closings, new service markets, an expanded list of suppliers, acquisitions… The only thing certain is change is inevitable so you must be flexible and prepared to adapt quickly.

Oracle Value Chain Execution
Oracle has strategically developed and acquired logistics applications to create an integrated suite called Oracle Value Chain Execution (VCE). Oracle VCE is a single solution to your logistics needs offering warehousing and inventory management, tracking, transportation management, trade compliance and management, landed cost analysis and suite-wide analytics capabilities. Whether you have a domestic oriented business or a global operation spanning multiple countries, VCE has the capabilities to support your needs. Oracle’s suite of supply chain execution applications include:

- Transportation Management
- Warehouse Management
- Global Trade Management
- Landed Cost Management
- Mobile Supply Chain applications
Oracle VCE is an open and integrated suite of applications

Using Oracle's open architecture standards, the VCE suite allows customers to easily install it within their existing technology stack. The Oracle VCE suite has components of, and/or is integrated to:

- PeopleSoft
- JD Edwards Enterprise One
- Oracle E-Business Suite
- Siebel CRM
- SAP
- Legacy systems

Transportation Management

Oracle Transportation Management is the leader in the transportation management marketplace. It delivers robust transportation planning and execution capabilities to shippers and third party logistics providers. It integrates and streamlines transportation planning, execution, freight payment, and business process automation on a single application, across all modes of transportation, from full truckload to complex multi-leg air, ocean, and rail shipments.

Warehouse Management

Oracle Warehouse Management enables companies to maximize their utilization of labor, space, and equipment investments by coordinating and optimizing resource usage and material flows. Oracle Warehouse Management supports domestic as well as global requirements all from a single, flexible technology platform.

Global Trade Management

Oracle's Global Trade Management solutions create a global technology platform from which any company can centrally manage all aspects of their trade needs. As part of the industry's first integrated trade and transportation system, Oracle Global Trade enables companies to automate and orchestrate cross-border transactions resulting in lower costs, accelerated cash flow, and minimized risk.

Landed Cost Management

Oracle Landed Cost Management gives organizations financial visibility into their extended supply chain costs, including transportation and handling fees, insurance, duties, and taxes. Since these types of charges are typically upwards of 40% of an items' total cost, it is critical to accurately include them in financial analysis and decision making activities. Oracle Landed Cost Management estimates these costs and later updates them with actual amounts as they become known, allocating them to shipments, orders, and products.

Mobile Supply Chain Applications

Oracle Mobile Supply Chain applications enable users to perform many common warehouse and shop floor transactions through hand-held radio frequency devices, personal digital assistants and truck-mounted radio frequency scanners. Transactions can be carried out on these wireless devices at the point of use, offering real time transaction processing, improved data accuracy and increased mobility and convenience.

Oracle Value Chain Execution

While each individual component of the VCE suite is a valuable addition to a strong logistics technology strategy, when used together, they offer substantially more benefits to the overall organization. A few of these benefits include:

- Improved Logistics Efficiency
- Lower Total Cost of Ownership
- Enhanced Analytics and Visibility
