Oracle Cloud Infrastructure (OCI) Security

Reduce concerns of advanced persistent threats

Adopt the cloud infrastructure that’s designed using security-first architecture

Security by design
Reduce risks from constant threats with security-first design principles that utilize built-in tenant isolation and least privilege access.

Isolated Network Virtualization designed to prevent lateral movement

Zero trust architecture with malware free hosts

Easy to implement security controls
Prevent misconfiguration errors and implement mandatory security best practices. Oracle Cloud Infrastructure has 24/7 always-on controls, with layered defenses.

Control and automation
Reduce misconfiguration errors and make security best practices mandatory.

Foundational security controls in OCI
Deep expertise in global data protection

Oracle Cloud Infrastructure is a second-generation infrastructure-as-a-service (IaaS) offering built with more than 40 years of global data protection. The security-first architecture design principles include isolated network virtualization and pristine physical host deployment, which provide superior customer isolation compared to earlier public cloud designs and reduced risk from advanced persistent threats. Oracle Cloud Infrastructure benefits from tiered defenses and highly secure operations that span from the physical hardware in our data centers to the web layer, in addition to the protections and controls available in our cloud. Many of these protections also work with third-party clouds and on-premise solutions to help secure modern enterprise workloads and data where they reside.
