INTRODUCTION

Digital disruption shock waves have sent all organizations a clear wake-up call that change is the only constant, and that obtaining deep data-driven insights fast is needed to survive and thrive. Business teams are eager to access ever more data to quickly answer new questions arising every day. However, the processes they relied on in the past may no longer be appropriate to meet new business demands, and may not help IT and lines of business to effectively partner.

In this white paper, we will first review why successful digital transformation and resiliency during crisis require business agility powered by data-driven insights. We will then consider the drawbacks of common data and analytics processes. Finally, we shall suggest a simple, reliable, and repeatable approach allowing business teams to easily get deep, trustworthy data-driven insights fast and make quick decisions, relying on a complete, governed and secure solution.

SUCCESSFUL DIGITAL TRANSFORMATION REQUIRES BUSINESS AGILITY

What is the #1 priority of CIOs? Driving and embedding digital transformation in the company business strategy. New technologies are disrupting what was once considered normal business operations, forcing companies to embrace digital transformation or be left behind.

According to a report by IDC, businesses will spend $2.3 trillion a year on digital transformation within the next four years. In 2023, digital transformation spending will amount to 53% of all worldwide technology investment for the year, with the largest growth in data intelligence and analytics as companies create information-based competitive advantages.

Digital transformation at its best involves a journey from inflexibility to a permanently agile condition. Being agile has indeed become more important than ever; it helps business teams to continually adapt to changing scope and deliverables, to manage changing priorities in a highly volatile environment.

A McKinsey survey shows that:

- Agile organizations have a 70% chance of being in the top quartile of performers. They are more resistant to disruption and simultaneously achieve greater customer centricity, faster time to market, higher revenue growth, lower costs, and have a more engaged workforce.

- 75% of business leaders say organizational agility is a top or top-three priority.

- Leaders believe that more of their employees should undertake agile ways of working: on average 68% compared with the 44% of employees who currently do.

---

1 https://www.alert-software.com/blog/top-cio-priorities
2 https://www.idc.com/getdoc.jsp?containerld=prUS45612419
Digital disruption will potentially wipe out 40% of Fortune F500\(^4\) firms by 2030, and according to Accenture, only a mere 20%\(^5\) of businesses are prepared to address it. Agile organizations will be able to constantly adapt to market changes rather than being impeded by them, they will be able to survive and thrive in a constantly changing environment, and therefore to win in the age of digital disruption.

The current pandemic has only been accelerating digital transformation initiatives as workforces have been required to go remote with very little time to prepare. According to a recent survey\(^6\), COVID-19 forced many organisations to operate at unprecedented levels of pace in order to adapt, and they have been able to achieve this by radically altering the way they manage change using agile principles.

As noted, the largest digital transformation investments will be in data intelligence and analytics, which should come as no surprise. Indeed, agile business teams need to be able to make decisions extremely quickly to take action, and the only way for them to confidently do so is to have data-driven insights at their fingertips.

**AGILE BUSINESS TEAMS NEED DATA-DRIVEN INSIGHTS**

All lines of business are in dire need of data-driven insights to meet new expectations.

Finance has radically evolved in the past few years. Their focus has shifted from back-office processing and reporting of historic results to forward looking forecasting and analysis of the business. Executives now expect finance to address their questions quickly, solve problems, and to make recommendations to drive business growth. As a matter of fact:

- 79% of CFOs rate data analytics as a priority\(^7\)
- 85% believe the finance organization must transform from reporting on “what” to “why”\(^8\)

Similarly, HR used to be primarily viewed as a business support function. HR is now considered a strategic advisor and expected to work with the leadership team to drive top and bottom-line results. The HR analytics market is planned to grow\(^9\) to $3.6 billion by 2025, with HR leaders aiming to use data analytics to improve productivity, learning, recruitment, retention, wellness, collaboration, and performance management.

---

\(^8\) [https://go.oracle.com/LP=88830?elqCampaignId=238833](https://go.oracle.com/LP=88830?elqCampaignId=238833)

Spending on marketing analytics will double\(^1\) to reach $4.68 billion by 2025. According to the 2020 CMO survey conducted by Gartner\(^2\): “76% of marketing leaders say they use data and analytics to drive key decisions. Yet, marketing organizations also struggle to evolve their data capabilities. Continued investment in technology and data talent is not optional for those with ambitions for their data.”

Finally, the fastest-growing companies are using data and analytics to radically improve their sales productivity and drive double-digit sales growth with minimal additions to their sales teams and cost base. Data-driven sales organizations are outperforming their peers\(^3\) in terms of revenue growth, profitability, and shareholder value.

Common to all lines of business is the fact that they are being asked to answer new questions every single day. Their agility can be measured by their ability to rapidly answer those questions, which in turn is highly correlated to their capability to independently turn data into insights. Armed with those insights, they can make the best decisions and take action.

While enterprise applications enable them to easily answer questions of the “what” type, e.g. “What is this quarter’s revenue?”, they tend to struggle to perform root cause analysis, to figure out the “why” beyond the “what”, e.g. “Why is profitability dropping for this product?”. Understanding trends and modeling future scenarios is equally difficult. To answer such questions, their transactional reporting is not sufficient, they need to consider data sets from other sources, both internal and external ones. That is typically where their data and analytics processes fall short and where they, as we will see, tend to heavily rely on spreadsheets and manual processes to blend and analyze data from different sources.

This is compounded by the fact that an increasing number of the questions lines of business need to answer nowadays require data from several departments and applications. For example, answering the question “Do we have the budget to increase compensation for our top performing sales reps at risk of leaving given quota attainment?” would require data from finance, HR and sales applications.

For IT, those needs translate into an increasing number of more and more complex demands from the different departments.

**Being agile also means being resilient**

As we could unfortunately notice throughout 2020, disruption events can occur at any time and in any form. They’re unpredictable and very hard to prepare for, and an agile business is more likely to be resilient.

---

\(^1\) [https://www.mordorintelligence.com/industry-reports/marketing-analytics-market](https://www.mordorintelligence.com/industry-reports/marketing-analytics-market)

Given a disruptive event, organizations typically go through 3 different stages. At each stage, business teams need to answer new questions and therefore need to swiftly obtain new data-driven insights.

- **Conserve**: During this first stage, organizations need to address the immediate challenges that the crisis/disruption has presented. Finance must for example support rapid decisions on resource usage, clarify the impact of HR decisions, and provide insights on different scenarios to the leadership team. For marketing, it's about figuring out the effect of the crisis on pipeline generation, and considering where to refocus efforts to minimize the overall impact.

- **Scale** is where the recovery begins. Once the end of the crisis/disruption is in sight or under control, it is important to scale back up as quickly as possible. The ability to rapidly select the most promising opportunities to fund and focus resources on is critical to a swift recovery and rapid growth. The crisis may also have presented new opportunities for some businesses, requiring new analysis and decisions to best take advantage of them.

- Finally, **Reimagine** the new normal once the crisis is over. Customer habits may have changed due to the disruption, implying new business models, processes, new channels, complying with new guidelines….etc. Internal policies and ways of working may also need to be revised. Data-driven insights are once more needed to make the right decisions.

A survey from Dresner Advisory Services on the impact of COVID-19 highlights the respondents’ strong belief that data-driven decision making is a must-have for their businesses to survive and eventually grow again. Businesses are seeing data and analytics as the radar they need to plan and execute strategies essential to their survival. According to the survey, 49% of enterprises are either launching new analytics and BI projects or moving forward without delay on already planned projects.

Whether a disruption event has occurred or not, business teams typically turn to IT to access new data sources and get help to turn data into insights. However, organizations tend to rely on processes that are far from being agile...

**COMMON DATA AND ANALYTICS PROCESSES DO NOT SUPPORT BUSINESS AGILITY**

The process represented in figure 1 is very common. It involves the following steps when new data or reports are required:

---

- IT receives a request from the business. Often times, IT will provide data extracts from various sources to the business teams (data from enterprise applications, web site data, external data...etc). IT can occasionally be asked to build and run Machine Learning models on the data and provide reports to analysts, which can require multiple rounds of specifications and revisions, taking time.

- Once business teams receive the data from IT they need to prepare it for analysis. By then analysts may already have new requirements, which means they may need to go back to IT with additional requests.

- They then need to set-up a workspace allowing workgroup members to access the data. Typical issues involve data security and the ability for all members to access the needed data, which often means that by the time they can start working on it, some of the data is already stale.

- The next step could often be referred to as “spreadsheet nightmare”: analysts tend to rely on spreadsheets to share and collaborate on the data. Unsurprisingly, this often results in human errors, confusion, complex reconciliations and multiple sources of truth. According to IDC\textsuperscript{14}, 80\% of the time is spent on searching, preparing and protecting data, with only 20\% spent on analysis.

- The actual analysis may be mostly reporting, as opposed to interactive discovery using Machine Learning capabilities, making it harder to surface unexpected insights.

- During management reviews data lineage (e.g. data provenance, what data sets were combined, what calculations were used) is unclear, which creates a lack of trust in the data and the predictions, and iterations are slow since they require going through the entire process again.

- Results may be shared via spreadsheets or slides, creating additional security issues.

\textsuperscript{14} https://www.idc.com/getdoc.jsp?containerId=US44930119

\textsuperscript{7} WHITE PAPER | Data-Driven Business Agility Without Compromise
Copyright © 2020, Oracle and/or its affiliates
There are multiple implications. This process is:

**Complex:** it involves many steps, often multiple tools, and is prone to human errors. Complex processes and architectures tend to also be more difficult, and costly, to integrate and manage on an ongoing basis.

**Slow:** going from data to decision may take weeks to months. Business teams are dependent on limited IT resources to obtain what they need, and complain about wait times. Additionally, IT needs to go through this unproductive exercise for each new request.

**Unsecure:** as noted, there are security risks throughout the entire process. Furthermore, frustrated business teams may take matters in their own hands and implement shadow IT environments/data marts, further increasing security risks. Indeed, according to a Gartner report\(^5\), a third of successful attacks experienced by enterprises will be on their shadow IT resources.

Most importantly, stakeholders do not trust the data and the predications, and are back to making decisions based on gut feelings as opposed to data-driven insights. Moreover, IT is not perceived as providing the business with what they need. They are not seen as enabling business agility despite the fact that 64% of IT operations leaders believe their job is to deliver an agile, responsive, and resilient infrastructure that can support fast-moving business requirements\(^6\).

**DATA-DRIVEN BUSINESS AGILITY WITH A GOVERNED AND SECURE SOLUTION**

The common and ineffective process we described represents an opportunity for IT to dramatically improve both results and collaboration with lines of business. IT can implement a new framework allowing business teams to obtain the data-driven insights they need much more rapidly, and independently, while maintaining control over the process and tools used to help ensure security. In other words, IT can provide the business with the self-service autonomy they want, relying on a governed and secure solution. Furthermore, IT can use a simple, reliable, and repeatable approach for all data analytics requests emanating from business teams, greatly improving their productivity and data governance.

**An Agile Approach**

Consider the process presented in figure 2 below. The time to get going with a new project and to go from data to decisions can be compressed from weeks or months to hours or days.

---

IT can provision a new departmental data warehouse for a business team requesting access to data and reports in minutes, and keep track of its purpose and usage. As we will see later in this document, Autonomous Data Warehouse eliminates virtually all the complexities of operating a data warehouse and securing data. As matter of fact, IT could also let business users set up data warehouse instances themselves in self-service mode. And they could do so using a governed, secure solution.

Business users can add data themselves, for example uploading spreadsheets. Once connections to the data sources they need are established, they can get live data whenever they need it, without having to go to IT each time. They no longer need to rely on periodic extracts. With smart data preparation, analysts can leverage Machine Learning recommendations to enrich datasets with a single click.

The data is available only to authorized users, via a shareable and secure workspace allowing secure collaboration within a workgroup.

Business teams no longer need to use spreadsheets to share data and collaborate, they can rely on a single data source, which means a single source of truth. Most importantly, all stakeholders trust the data, having clear visibility on data lineage.

Analysts can focus their time on data analysis, not on manually obtaining data extracts, blending data sources in spreadsheets, trying to protect data…etc

When analyzing the data, they can leverage the interactive self-service discovery capabilities of Oracle Analytics Cloud powered by Machine Learning. They don’t start with a blank canvas but with auto-created visuals based on their data. They can ask the system to explain it for them automatically, which gives them great insights and answers to questions they perhaps didn’t even think of asking.

With Autonomous Data Warehouse as their data platform, users always get excellent performance for their queries, even at busy times, while only ever paying for resources they use. They can analyze all the data they need, no need to sacrifice data sets. And consistent high
query performance enables to empower business users in finance, HR, marketing and other departments with secure and fast data access.

- Analysts can securely present results to executives with visual stories and iterate very quickly to address any further demands they may get.

With such a solution, data can be trusted, and fact-based decisions rapidly taken. This agile approach presents multiple benefits for both IT and business teams:

ARCHITECTURE AND COMPONENTS

Analysts need an efficient way to consolidate data from multiple systems, spreadsheets and other data sources into a trusted, maintainable, and query-optimized source. With Oracle Autonomous Data Warehouse and Oracle Analytics Cloud, you can load and optimize data from Oracle applications, non-Oracle applications, spreadsheets and other sources into a centralized departmental data warehouse.

The architecture presented in figure 3 uses Oracle Data Integrator to load and optimize data from multiple sources into a centralized Oracle Autonomous Data Warehouse and then uses Oracle Analytics Cloud to analyze the data to provide actionable insights.
Starting on the left, any data source can be considered. Data from enterprise applications, from spreadsheets, third party data...etc.

Data can be refined (e.g. pre-process of raw unstructured data for analysis) before being loaded into Autonomous Data Warehouse. With Oracle Data Integrator, IT can create mappings between data sources and targets to refine and cleanse the data using both ETL and E-LT methods. Business users can also load data on their own using Oracle Analytics Cloud's data flow capability, a click and drag approach with zero coding.

Data is persisted in Autonomous Data Warehouse. The idea is indeed to create, in minutes, a departmental data warehouse to support a specific functional area, for example, finance profitability reporting, HR attrition, or marketing click-stream analytics. Each use case is self contained and supports a specifically identified group.

Oracle Analytics Cloud is connected to Autonomous Data Warehouse, allowing business users to visualize data, build reports and dashboards, and run analysis.

Additionally, data scientists can access the data directly in Autonomous Data Warehouse to build, evaluate and deploy machine learning models in-database, without moving data across systems.

A Terraform code for this reference architecture is available on GitHub, allowing rapid implementation.

Let's now consider in slightly more details the benefits of using Autonomous Data Warehouse as the data persistence platform.

**Autonomous Data Warehouse**

Oracle Autonomous Data Warehouse is a cloud data warehouse service that eliminates virtually all the complexities of operating a data warehouse and securing data. It automates provisioning, configuring, securing, tuning, scaling, patching, backing up, and repairing of the data warehouse. Unlike other “fully managed” cloud data warehouse solutions that only patch and update the service, it also features elastic, automated scaling, performance tuning, security, and a broad set of built-in capabilities that enable machine learning analysis, simple data loading, and data visualizations. It’s available in both the Oracle public cloud and customers’ data centers with Oracle Cloud@Customer.

Key reasons to choose Autonomous Data Warehouse include:

**Automated data warehouse management**

Autonomous Data Warehouse intelligently automates provisioning, configuring, securing, tuning, and scaling a data warehouse. This eliminates nearly all the manual and complex tasks that can introduce human error. Autonomous management will enable customers to run a high-performance, highly available, and secure data warehouse while reducing administrative costs.
A complete solution for all your data sets

Autonomous Data Warehouse is the only complete solution that has built-in support for multimodel data and multiple workloads such as analytical SQL, machine learning, graph, and spatial. It requires no integration with other services, making it easy to load any data, run complex queries, build sophisticated analytical models, visualize information, and deliver dashboards.

Consistent high performance for any number of concurrent users

Autonomous Data Warehouse uses continuous query optimization, table indexing, data summaries, and auto-tuning to ensure consistent high performance even as data volume and number of users grow. Autonomous scaling can temporarily increase compute and I/O by a factor of three to maintain performance. Unlike other cloud services which require downtime to scale, Autonomous Data Warehouse scales while the service continues to run.

Comprehensive data and privacy protection

Autonomous Data Warehouse makes it easy to keep data safe from outsiders and insiders. It autonomously encrypts data at rest and in motion (including backups and network connections), protects regulated data, applies all security patches, enables auditing, and performs threat detection. In addition, customers can easily use Oracle Data Safe to conduct ongoing security assessments, user and privilege analysis, sensitive data discovery, sensitive data protection, and activity auditing. Autonomous Data Warehouse protects the organization and all data against data breaches, malware injections, DDoS attacks, malicious insiders, advanced persistent threats, insecure APIs, account hijacking, and more.

Other components presented in the architecture include:

**Oracle Data Integrator**: a comprehensive data integration platform that covers all data integration requirements: from high-volume, high-performance batch loads, to event-driven, trickle-feed integration processes, to SOA-enabled data services. You can download Oracle Data Integrator from [Oracle Cloud Marketplace](https://cloud.oracle.com/).

**Oracle Analytics Cloud**: Oracle Analytics Cloud empowers business analysts with modern, ML-powered, self-service analytics capabilities for data preparation, visualization, enterprise reporting, augmented analysis, and natural language processing/generation. You also get flexible service management capabilities, including fast setup, easy scaling and patching, and automated lifecycle management.

Unlike other products that require you to compromise between governed, centralized analytics, and self-service, Oracle Analytics Cloud resolves this dilemma with a single solution that incorporates machine learning into every step of the process. With Oracle Analytics Cloud, augmented analytics, self-service analytics, and governed analytics can be combined into a single solution.
The core capabilities of Oracle Analytics Cloud are:

- Self-service, approach to enable users to create stunning visuals to explain their results and share them with colleagues
- Data preparation and enrichment, which is built into the analytics cloud platform
- Business scenario modeling, an industry-leading modeling engine for self-service, multidimensional, and visual analyses
- Proactive mobile that learns your routine and delivers contextual insights, at the right time and location in your daily activities while on the go
- Enterprise reporting, governance, and security, with a semantic layer that maps complex data into familiar business terms and offers a consolidated view of data across the organization

No other solution combines this array of capabilities to satisfy the needs of your entire organization, at any scale.

Learn more about Oracle Analytics Cloud

Autonomous Data Warehouse is additionally certified with numerous third-party analytics and integration tools.

A REPEATABLE APPROACH FOR DEPARTMENTAL DATA WAREHOUSES

The solution we described provides IT teams with a simple, reliable, and repeatable approach to address the demands from business teams:

1. Select a specific use case with a well-defined scope, e.g. profitability analytics for finance, based on demands from lines of business
2. Deploy the solution, using the aforementioned architecture
3. Allow business teams to iterate on their own to find a model, reports, dashboards that work for them leveraging Machine Learning, independently from IT but with a secure and governed solution
4. Celebrate successes! Quick wins ensure adoption, and the word is spreading…
5. Apply the process for the next use case. It could be another functional reporting area within the same department (cost management in finance) or a different department entirely (campaign analytics in marketing or attrition analytics in HR). Autonomous Data Warehouse allows you to instantly clone a departmental data warehouse with either the metadata only or the full data
6. Decommission departmental data warehouses if/when they’re no longer needed and reallocate resources to new ones
This approach provides business teams with the agility they need to be successful. They can rapidly iterate and experiment on their own, without relying on IT. And they can do so within a secure, IT managed, framework.

IT teams can free themselves from the manual constraints preventing them to effectively address the demands from LOBs, and they can shift their time and focus from routine database administration tasks to innovation and helping business departments achieve their goals.

It furthermore represents a path to the cloud for organizations gradually aiming to move their workloads to the cloud. Additionally, customers choosing Oracle for their departmental data warehouses will easily be able to support broader potential needs for data lakes, data science and enterprise data warehouse. Oracle indeed delivers a complete, integrated solution of data warehouse, integration, ETL, data lake, data science, and analytics services. Customers can ingest any data batch, streaming or real-time, store in data warehouse or data lakes, catalog and govern, visualize and analyze, and build and deploy machine learning solutions. With our integrated solution, customers can leverage security policies across the data warehouse and data lake, as well as query the data lake from the data warehouse. Built-in support for multimodel data and multiple workloads such as analytical SQL, machine learning, graph, and spatial in a single database instance eliminates the integration complexity and administration that is required with other providers.

Reference architectures such as the one presented earlier for departmental data warehouses are available for each use case.
CUSTOMER SUCCESSES

Unior Group

Unior Group, based in Zreče, Slovenia, supplies a wide range of products and services, from manufacturing specialized automotive and bicycle tools, to machine equipment, to offering metal processing and even tourism services. The company, which was founded in 1919, traces its heritage to the rich blacksmith tradition of the Pohorje area of northeastern Slovenia. Unior employs nearly 4,000 people and operates subsidiaries in 15 countries including China, France, Germany, Great Britain, Italy, Russia, and the United States.

It was taking months for Unior Group to derive meaningful insights from the millions of data records it was generating. But now, having implemented Oracle Autonomous Data Warehouse and Oracle Analytics Cloud, the company gains those insights in a matter of seconds.

“With dashboards updating every day, we have the insights to make the right decisions,” says CIO Rok Planinšec. “We can see what stock we have, how we compare to the competition, and where to focus our spending and sales team.” Planinšec calls it “a radical change,” with Oracle Cloud “we’re not just keeping up, we are firmly in the driver’s seat.”

Arlington Orthopedic

For more than 20 years, Arlington Orthopedic specialists have provided patients throughout North Texas with specialty orthopedic healthcare services. Arlington Orthopedic employs 36 physicians and medical professionals, and offers more than 40 precision orthopedic specialties, treating patients for joint and spine pain, injuries, replacement, and reconstruction.

New bundled payment models introduced by the Centers for Medicare and Medicaid in 2018 require practices like Arlington Orthopedic to provide certain healthcare services at negotiated prices for Medicare and Medicaid members. In order to avoid losses, Arlington must analyze every facet of its operations to make sure its costs don’t exceed contracted pricing agreements.

Using Autonomous Data Warehouse and Oracle Analytics Cloud, Arlington staff can visualize detailed financial scenarios instantly, helping them negotiate the right rates with insurance carriers, and then allocate those savings toward programs that improve patient care. Such rapid analysis also has helped Arlington speed up payment and claims investigations, boosting company revenue by 18%. Patient count has doubled without adding maintenance and support IT costs and resources.

“Without the Oracle system, I would probably need to hire five or six financial analysts to perform the same volume and quality of analytics” says CFO Honey Ranario.

Discover how many other customers are succeeding with Autonomous Data Warehouse.
CONCLUSION

Rapidly getting data-driven insights has become a sine qua non condition to accelerate innovation, beat the competition and harness disruption. Processes of the past may no longer be appropriate to meet new business demands. According to Gartner, public cloud services will be essential for 90% of data and analytics innovation by 2022\(^7\). Oracle Departmental Data Warehouse is a complete solution enabling business teams to get the deep, trustworthy, data-driven insights they need to make quick decisions. Governed and secure, the solution reduces risks and complexity while increasing both IT and analysts’ productivity. IT teams can additionally rely on a simple, reliable, and repeatable approach for all data analytics requests from business departments. Select a first project and try out our Oracle Departmental Data Warehouse solution!
