Acme Packet 1100
Enterprise Session Border Controller (E-SBC)

Acme Packet 1100 is an enterprise-session border controller appliance optimized for small to medium-sized business (SMB) and remote offices of large organizations. The compact appliance provides critical controls for delivering trusted, first-class real-time communications – voice, video, and multimedia sessions – across Internet Protocol (IP) network borders.

Overview

The Acme Packet 1100 E-SBC is specifically designed to meet the unique price-performance and manageability requirements of the small to medium-sized enterprise and remote office / branch office. Ideal for small site border control and Session Initiation Protocol (SIP) trunking service termination applications, Acme Packet 1100 delivers Oracle’s industry-leading E-SBC capabilities in a small form-factor appliance. With support for high availability (HA) configurations, TDM fallback, hardware-assisted transcoding and Quality of Service (QoS) measurement, Acme Packet 1100 is a natural choice when uncompromising reliability and performance are needed in an entry-level appliance.

With models designed for the smallest branch office to the largest data center, the Acme Packet E-SBC product family supports distributed, centralize, or hybrid SIP trunking topologies.

Features

Acme Packet 1100 addresses the unique connectivity, security, and control challenges enterprises often encounter when extending realtime voice, video, and UC sessions to smaller sites. The appliance also helps enterprises contain voice transport costs and overcome the unique regulatory compliance challenges associated with IP telephony.

TDM fallback capabilities ensure continuous dial-out service at remote sites in the event of WAN or SIP trunk failures. Stateful high availability configurations protect against link and hardware failures. An embedded browser based graphical user interface (GUI) simplifies setup and administration.
Network Session Delivery and Control Infrastructure

Oracle’s network session delivery and control infrastructure enables enterprises and service providers to manage the many challenges in the delivery of IP voice, video, and data services and applications.

Distributed enterprises leverage Acme Packet 1100 as a cost effective, reliable, feature rich remote office ESBC that is easy to install and administer.

Service providers leverage Acme Packet 1100 as customer premise equipment (CPE) to enable SIP trunking and hosted communications services. The appliance serves as a flexible and resilient service demarcation point that can be easily managed from the service provider Network Operations Center (NOC).

Capabilities

**ACME PACKET 1100 E-SBC FEATURES AND CAPABILITIES**

Management

- Browser-based GUI
- SIP Monitoring and tracing tool
- SNMP, Syslog, SFTP, RADIUS interfaces

System Capacity, Performance, and Availability

Acme Packet 1100 supports up to 360 sessions, offers high availability (HA) operation for nonstop service, and supports hardware-assisted transcoding and quality of service (QoS) measurement.

<table>
<thead>
<tr>
<th>Capability</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Session capacity</td>
<td>Up to 360 simultaneous signaled sessions</td>
</tr>
<tr>
<td>Subscriber capacity</td>
<td>Up to 5,000 registered endpoints (UDP / TCP / TLS)</td>
</tr>
<tr>
<td>HA configuration</td>
<td>Active/standby systems (1-to-1 redundancy) with check-pointing of signaling, media, and configuration state for no loss of service</td>
</tr>
<tr>
<td>SRTP capacity</td>
<td>Up to 180 call legs</td>
</tr>
<tr>
<td>Transcoding capacity</td>
<td>Up to 360 transcoded sessions (with optional hardware assist module)</td>
</tr>
</tbody>
</table>

a. Performance and capacity vary by signaling protocol, call flow, codec, configuration, and feature usage.

Hardware

Acme Packet 1100 combines remote office session processing and capacity, with the system throughput and redundancy features typically found in higher-end systems. The compact unit can be rack-mounted (1RU), wall-mounted, or installed on a tabletop.

Hardware Options

Onboard Transcoding Module

Acme Packet 1100 supports an optional hardware module for onboard media transcoding. The module offloads processor-intensive functions, enabling high-performance transcoding without compromising end-user quality of experience.

T1/E1 TDM Fallback Module

Acme Packet 1100 supports an optional one port or four port T1/E1 interface module for TDM fallback. In centralized SIP trunking topologies the module preserves voice services in the event of a corporate WAN connectivity failure. In distributed SIP trunking topologies the module preserves dial-out voice services in the event of a local SIP trunk interface failure.

Acme Packet 1100 also supports analog and BRI modules to allow customers to route between SIP and TDM for resiliency. Each port can be individually set up (EURO ISDN, QSIG) to comply with specific needs. Fax T.38 transcoding is supported for ease of integration.
