You’ve invested in 5G. Now it’s time to monetize. 5G is an opportunity to enhance customer experience and generate new revenue. But monumental technical challenges are facing the 5G converged charging system. Are you ready for hyperscale charging demands?

**New Technical Challenges for 5G Monetization**

5G converged charging systems are the real-time experience engine for digital BSS (Business Support Systems). They must be able to monetize any commercial offer with support for increasingly complex 5G business models. Real-time transactions must be processed using hyperscale performance, scalability and availability. And all must be achieved in a cloud native model, while reducing costs and enabling faster time to cash across the entire revenue lifecycle.

**Oracle Converged Charging System**

Introducing Oracle’s Converged Charging System (CCS)—a cloud-native, network-grade charging solution that lets you monetize every generation of mobile network with operational excellence.

*In a performance test for 50 million subscribers as part of a cloud native deployment on Oracle Cloud Infrastructure and using industry-realistic charging scenarios, Oracle’s CCS achieved single digit millisecond latency, high transaction throughput, efficient resource utilization and near linear scalability.*

Oracle CCS is engineered for the hyperscale charging demands of 5G service providers. It provides an in-memory charging grid which co-locates data & processing, to deliver extremely fast rating and balance management, with complete transactional consistency.

Designed to bridge network and IT domains, Oracle CCS also provides industry-leading revenue management to efficiently monetize the revenue lifecycle of any commercial offer or business model with DevOps-driven operational agility.

---

**Oracle Converged Charging Cloud Native Performance Test**

View the full report.

- 50 million subscribers: 90% prepaid, 10% postpaid
- Includes industry realistic price plans
- Mixed traffic and charging operation types
- Cloud native deployment

**Single Digit Millisecond Latency**

*Measured as a roundtrip between the internal network GW charging requests and the core charging server instances.

**Linear Scalability**

*Efficient Resource Utilization**
