

# ORACLE

Configuring the Oracle SBC with Microsoft  
Teams Direct Routing Non-Media Bypass -  
Enterprise Model

**Technical Application Note**

**ORACLE**  

---

**COMMUNICATIONS**

## **Disclaimer**

The following is intended to outline our general product direction. It is intended for information purposes only, and may not be incorporated into any contract. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, and timing of any features or functionality described for Oracle's products remains at the sole discretion of Oracle.

## Revision History

Version	Description of Changes	Date Revision Completed
1.0	Added Web GUI	12-09-2019
2.0	<ul style="list-style-type: none"><li>Added Missing sip-manipulation</li><li>Added bug fixes ACMESOLU-106</li></ul>	21-10-2019
3.0	<ul style="list-style-type: none"><li>Modified Media Manger Options</li><li>Added notes regarding new features in 830M1P8A</li><li>Modified Appendix B</li><li>Added Appendix D</li><li>Add Alert and associated Important Info</li><li>Added Config for E911 and Elin Gateway</li></ul>	01-06-2020
4.0	<ul style="list-style-type: none"><li>Corrected spelling mistakes in media-manager config.</li><li>Modified powershell screenshots with Microsoft latest update</li><li>Removed media-profile config for CN</li></ul>	19-02-2021
5.0	<ul style="list-style-type: none"><li>Corrected match value in SDP-line-rule</li></ul>	10-05-2021
6.0	<ul style="list-style-type: none"><li>Modified Appendix C</li></ul>	31-08-2021

### 1 *Alert:*

***Before Moving Forward in this Document, Please Read:***

***Due to planned upgrades to Microsoft Teams Direct Routing Platform, there are mandatory changes that are required to the Oracle Session Border Controller Configuration in some environments. If these changes are not implemented in the near future, there may be risk of call failures. Please See [Appendix D/Important Note](#) for more details:***

***Please reach out to your Oracle Account Team with any questions regarding this notification.***

## 2 Introduction

This document describes how to connect the Oracle SBC to Microsoft Teams Direct Routing. This paper is intended for IT or telephony professionals.

## 3 About Microsoft Teams Direct Routing

Microsoft Teams Direct Routing allows a customer provided SBC to connect to Microsoft Phone System. The customer provided SBC can be connected to almost any telephony trunk or interconnect 3rd party PSTN equipment. The scenario allows:

- Use virtually any PSTN trunk with Microsoft Phone System;
- Oracle Enterprise Session Border Controllers are Microsoft certified to work for Direct Routing. Additional information can be found at:

<https://docs.microsoft.com/en-us/microsoftteams/direct-routing-border-controllers>

### 3.1 Planning Direct Routing

If you are planning to configure direct routing with Oracle SBC, you must ensure that the following prerequisites are completed before proceeding further

- Tenant requirements
- Licensing and other requirements
- SBC domain names
- Public trusted certificate for the SBC
- SIP Signaling: FQDNs
- Transcoding Resources for the SBC (CN, RTCP, and Ringback)

#### 3.1.1 Tenant Requirements

Make sure that you have a custom domain on your O365 tenant. Here we have created an account [soladmin@solutionslab.onmicrosoft.com](mailto:soladmin@solutionslab.onmicrosoft.com).

Likewise create an account, which is not the default domain created for your tenant. For more information <https://docs.microsoft.com/en-us/microsoftteams/direct-routing-plan#sbc-domain-names>

#### 3.1.2 Licensing Requirements

Make sure that the following license requirements are met by the Direct routing users. (ie the users must be assigned the following licenses in Office 365)

- Microsoft Phone System
- Microsoft Teams + Skype for Business Plan 2 if included in Licensing Sku

### 3.1.3 DNS Requirements

Create DNS records for domains in your network that resolve to your SBC.

Before you begin, make sure that you have the following per every SBC you want to pair:

- Public IP address
- FQDN name resolving to the Public IP address

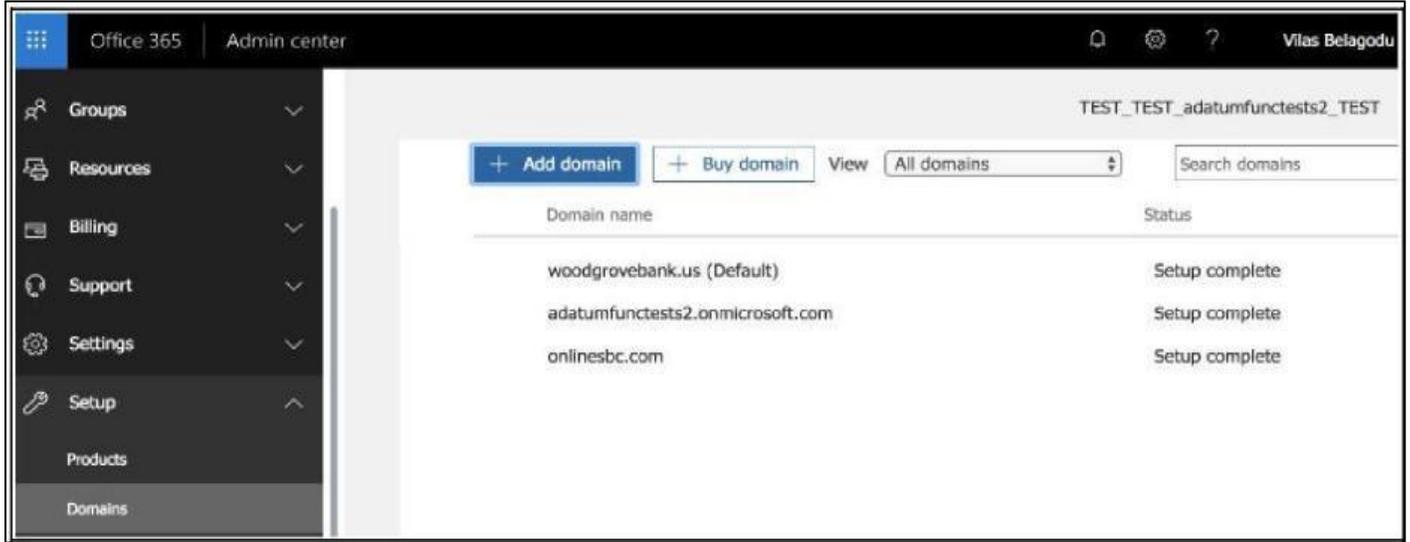

### 3.1.4 SBC Domain Names

The SBC domain name must be from one of the names registered in “Domains” of the tenant. You cannot use the \*.onmicrosoft.com tenant for the domain name.

For example, on the picture below, the administrator registered the following DNS names for the tenant:

DNS Name	Can be used for SBC FQDN	Examples of FQDN names
<a href="http://woodgrovebank.us">woodgrovebank.us</a>	Yes	Valid names: <ul style="list-style-type: none"><li>• <a href="http://sbc1.woodgrovebank.us">sbc1.woodgrovebank.us</a>;</li><li>• <a href="http://ussbcs15.woodgrovebank.us">ussbcs15.woodgrovebank.us</a></li><li>• <a href="http://europe.woodgrovebank.us">europe.woodgrovebank.us</a></li></ul> Non-Valid name: <ul style="list-style-type: none"><li>• <a href="http://sbc1.europe.woodgrovebank.us">sbc1.europe.woodgrovebank.us</a> (requires registering domain name <a href="http://europe.atatum.biz">europe.atatum.biz</a> in “Domains” first)</li></ul>
<a href="http://woodgrovebankus.onmicrosoft.com">woodgrovebankus.onmicrosoft.com</a>	No	Using *.onmicrosoft.com domains is not supported for SBC names
<a href="http://hybridvoice.org">hybridvoice.org</a>	Yes	Valid names: <ul style="list-style-type: none"><li>• <a href="http://sbc1.hybridvoice.org">sbc1.hybridvoice.org</a></li><li>• <a href="http://ussbcs15.hybridvoice.org">ussbcs15.hybridvoice.org</a></li><li>• <a href="http://europe.hybridvoice.org">europe.hybridvoice.org</a></li></ul> Non-Valid name: <ul style="list-style-type: none"><li>• <a href="http://sbc1.europe.hybridvoice.org">sbc1.europe.hybridvoice.org</a> (requires registering domain name <a href="http://europe.hybridvoice.org">europe.hybridvoice.org</a> in “Domains” first)</li></ul>

Please activate and register the domain of tenant.

In this document the following FQDN and IP is used as an example:

Public IP	FQDN Name
155.212.214.173	Oracleesbc.woodgrovebank.us

### 3.1.5 Public trusted certificate for the SBC

It is necessary to setup a public trusted certificate for direct routing. This certificate is used to establish TLS connection between Oracle SBC and MS Teams. The certificate needs to have the SBC FQDN in the subject, common name, or subject alternate name fields. For root certificate authorities used to generate SBC certificate refer to Microsoft documentation. <https://docs.microsoft.com/en-us/microsoftteams/direct-routing-plan#public-trusted-certificate-for-the-sbc>

## 3.2 Configure Direct Routing

The SBC has to be paired with the Direct routing interface for direct routing to work. To achieve this, follow the below steps

### 3.2.1 Establish a remote PowerShell session to Skype for Business Online

The first step is to download Microsoft PowerShell .For more information and downloading the client, visit Microsoft's website <https://docs.microsoft.com/en-us/SkypeForBusiness/set-up-your-computer-for-windows-powershell/set-up-your-computer-for-windows-powershell>.

To establish a remote connection, follow the below steps

Open PowerShell and type in the below commands

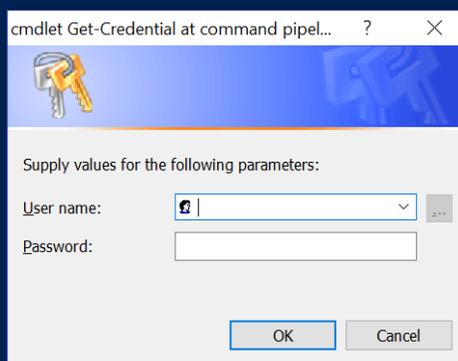

```
Import-Module -Name MicrosoftTeams
$userCredential = Get-Credential
$sfbsession = New-CsOnlineSession -Credential $userCredential
Import-PSSession $sfbsession
```

```
PS C:\WINDOWS\system32> Import-Module -Name MicrosoftTeams
$userCredential = Get-Credential
$sfbsession = New-CsOnlineSession -Credential $userCredential
Import-PSSession $sfbsession
cmdlet Get-Credential at command pipeline position 1
Supply values for the following parameters:
```

- PowerShell prompts for a username and password. Enter the tenant username and password. Tenants are used in pairing the SBC with the direct routing interface.

```
PS C:\Users\gabalakr> Import-Module SkypeOnlineConnector
$userCredential = Get-Credential
$sfbsession = New-CsOnlineSession -Credential $userCredential
Import-PSSession $sfbsession

cmdlet Get-Credential at command pipeline position 1
Supply values for the following parameters:
```

The screenshot shows a PowerShell console window with the following text:

```
cmdlet Get-Credential at command pipel... ? X
```

The dialog box has a title bar with a question mark and a close button. It contains a key icon and the text "Supply values for the following parameters:". Below this, there are two input fields: "User name:" with a dropdown arrow and a small icon, and "Password:" with a text box. At the bottom, there are "OK" and "Cancel" buttons.

```
PS C:\WINDOWS\system32> Import-Module -Name MicrosoftTeams
$userCredential = Get-Credential
$fbSession = New-CsOnlineSession -Credential $userCredential
Import-PSSession $fbSession
cmdlet Get-Credential at command pipeline position 1
Supply values for the following parameters:

ModuleType Version Name ExportedCommands
-----
Script 1.0 tmp_tyo0ug1c.age {Clear-CsOnlineTelephoneNumberReservation, ConvertTo-JsonForPSW...

PS C:\WINDOWS\system32> |
```

- Now the remote connection is established. Check whether the remote connection is proper by using the below command  
 "Get-Command \*onlinePSTNGateway\*"
 The command will return the four functions shown here that will let you manage the SBC.

```
PS C:\Users\gabalagr> Get-Command *onlinePSTNGateway*

CommandType Name Version Source
-----
Function Get-CsOnlinePSTNGateway 1.0 tmp_fcnyz43x.w0h
Function New-CsOnlinePSTNGateway 1.0 tmp_fcnyz43x.w0h
Function Remove-CsOnlinePSTNGateway 1.0 tmp_fcnyz43x.w0h
Function Set-CsOnlinePSTNGateway 1.0 tmp_fcnyz43x.w0h
```

### 3.2.2 Pair the SBC to tenant

To pair SBC to the tenant, type the command as shown below. Here the FQDN used is oraclesbc.woodgrovebank.us

```
New-CsOnlinePSTNGateway -Fqdn <SBC FQDN> -SipSignalingPort <SBC SIP Port> -MaxConcurrentSessions <Max Concurrent Sessions the SBC can handle> -Enabled $true
```

For more information ,please visit the Microsoft documentation here:

<https://docs.microsoft.com/en-us/microsoftteams/direct-routing-configure#connect-to-skype-for-business-online-by-using-powershell>

```
PS C:\Users\gabalagr>
PS C:\Users\gabalagr> New-CsOnlinePSTNGateway -Fqdn oraclesbc2.woodgrovebank.us -SipSignalingPort 5061 -MaxConcurrentSessions 500 -Enabled $true -MediaBypass $false
```

After pairing, we can check whether the SBC is present in the list of paired SBC's by typing in the command:

```
Get-CsOnlinePSTNGateway -Identity oraclesbc2.woodgrovebank.us
```

The details of the gateway are listed when the above command is entered.

Verify whether the enabled parameter is set to true.

The OPTIONS ping from the SBC is now responded with 200OK.Once there are incoming options to the direct routing interface, it starts sending OPTIONS to the SBC.

```

Identity                : oracleesbc2.woodgrovebank.us
Fqdn                    : oracleesbc2.woodgrovebank.us
SipSignallingPort      : 5061
FailoverTimeSeconds    : 10
ForwardCallHistory     : True
ForwardPai              : True
SendSipOptions         : True
MaxConcurrentSessions  :
Enabled                 : True
MediaBypass            : False
GatewaySiteId          :
GatewaySiteLbrEnabled  : False
FailoverResponseCodes  : 408,503,504
GenerateRingingWhileLocatingUser : True
PidflSupported         : False
MediaRelayRoutingLocationOverride :
ProxySbc                :
BypassMode              : None

```

### 3.2.3 Enable users for Direct Routing

To add users, create a user in Office 365 and assign a license. Here the following user is created:  
[teamsuser1@woodgrovebank.us](mailto:teamsuser1@woodgrovebank.us)

Here the following license is added

- Office 365 Enterprise E5 (including SfB Plan2, Exchange Plan2, Teams, and Phone System)

The screenshot shows the Microsoft 365 Admin Center interface. On the left is a navigation pane with options like Home, Users, Groups, Billing, Setup, and Customize navigation. The main area displays a 'User management' card for 'TeamsUser1' (teamsuser1@woodgrovebank.us). The user's profile is shown with various settings and actions:

TeamsUser1 teamsuser1@woodgrovebank.us	
Change	Reset password   Block sign-in   Delete user
Username / Email	teamsuser1@woodgrovebank.us <a href="#">Edit</a>
Aliases	teamsuser1@adatumfuncstests2.onmicrosoft.com
Product licenses	Office 365 E5 <a href="#">Edit</a>
Group memberships (1)	Solutions <a href="#">Edit</a>
Sign-in status	Sign-in allowed <a href="#">Edit</a>
Office installs	View and manage which devices this person has Office apps installed on. <a href="#">Edit</a>
Roles	User (no admin access) <a href="#">Edit</a>
Preferred Data Location	
Contact information	TeamsUser1 <a href="#">Edit</a>

Verify whether the user is homed in Skype for business Online by issuing the below command in PowerShell

“Get-CsOnlineUser -Identity "<User name>" | fl RegistrarPool”

Here the “infra.lync.com” verifies that the user is homed.

```
PS C:\WINDOWS\system32> Get-CsOnlineUser -Identity "teamsuser1@telechat.o-test06161977.com" | fl RegistrarPool
RegistrarPool : sippoolSN44A01.infra.lync.com
```

### Assign a phone number to the user

After creating a user, a phone number and voice mail has to be assigned through Powershell. Enter the below command for assigning a phone number.

Set-CsUser -Identity "<User name>" -EnterpriseVoiceEnabled \$true -HostedVoiceMail \$true -OnPremLineURI tel:<E.164 phone number>

```
PS C:\WINDOWS\system32> Set-CsUser -Identity "teamsuser2@woodgrovebank.us" -EnterpriseVoiceEnabled $true -HostedVoiceMail $true -OnPremLineURI +17841313123
```

The phone number used has to be configured as a full E.164 phone number with country code.

### Configure Voice Routing

Voice Routing is performed by the direct routing Interface based on the following elements

- Voice Routing Policy
- PSTN Usages
- Voice Routes
- Online PSTN Gateway

Here is an example to configure routes, PSTN usage, voice routing policy and assigning the policy to user.

1. Create the PSTN Usage "US and Canada".

```
PS C:\Users\gabalakr> Set-CsOnlinePstnUsage -Identity Global -Usage @{Add="US and Canada"}
```

2. Verify this by executing the command below

```
PS C:\Users\gabalakr> Get-CsOnlinePSTNUsage
```

```
Identity : Global  
Usage    : {US and Canada}
```

```
PS C:\Users\gabalakr>
```

3. Configure voice route as shown below. Here all calls are routed to the same SBC. This is achieved by using -NumberPattern "\*".

```
New-CsOnlineVoiceRoute -id "$Routename" -NumberPattern "*" -OnlinePstnGatewayList  
"oracleesbc2.woodgrovebank.us" -Priority 5 -OnlinePstnUsages "US and Canada"
```

```
PS> New-CsOnlineVoiceRoute -id "Bedford1" -NumberPattern "*" -OnlinePstnGatewayList "oracleesbc2.woodgrovebank.us" -Priority 5 -OnlinePstnUsages "US and Canada"
```

4. Verify the configuration by typing in the following command Get-CsOnlineVoiceRoute

```
Identity          : Oracle_US  
Priority          : 3  
Description       :  
NumberPattern    : ^(\+1[0-9]{10})$  
OnlinePstnUsages : {Oracle_US}  
OnlinePstnGatewayList : {sbc2.customers.telechat.o-test06161977.com, oracleesbc2.woodgrovebank.us}  
Name             : Oracle_US
```

5. Create a Voice Routing Policy "US Only" and add to the policy the PSTN Usage "US and Canada.". Use the following command

```
New-CsOnlineVoiceRoutingPolicy "US Only" -OnlinePstnUsages "US and Canada"
```

This can be verified through the following command.

```
PS C:\Users\gabalakr> Get-CsOnlineVoiceRoutingPolicy
```

```
Identity           : Global
OnlinePstnUsages   : {}
Description        :
RouteType          :

Identity           : Tag:US Only
OnlinePstnUsages   : {US and Canada}
Description        :
RouteType          : BYOT
```

6. Grant to user teamsuser1 a voice routing policy by using PowerShell

```
PS C:\WINDOWS\system32> Grant-CsOnlineVoiceRoutingPolicy -Identity "teamsuser2@woodgrovebank.us" -PolicyName "US Only"
```

7. Validate the same using the PowerShell command as shown below

```
$GetUserDetails=Get-CsOnlineUser -Identity teamsuser2@woodgrovebank.us
$GetUserVoiceRoutePolicy = $GetUserDetails.OnlineVoiceRoutingPolicy
```

### 3.3 Microsoft Teams Direct Routing Interface characteristics

Table 1 contains the technical characteristics of the Direct Routing Interface. Microsoft, in most cases, uses RFC standards as a guide during the development. However, Microsoft does not guarantee interoperability with SBCs even if they support all the parameters in table 1 due to specifics of implementation of the standards by SBC vendors. Microsoft has a partnership with some SBC vendors and guarantees their device's interoperability with the interface. All validated devices are listed on Microsoft's site. Microsoft only supports the validated devices to connect to Direct Routing Interface. Oracle is one of the vendors who have a partnership with Microsoft.

Ports and IP	SIP Interface FQDN Name	Refer to Microsoft documentation	
	IP Addresses range for SIP interfaces	Refer to Microsoft documentation	
	SIP Port	5061	
	IP Address range for Media	Refer to Microsoft documentation	
	Media port range on Media Processors	Refer to Microsoft documentation	
	Media Port range on the client	Refer to Microsoft documentation	
Transport and Security	SIP transport	TLS	
	Media Transport	SRTP	
	SRTP Crypto Suite	AES_CM_128_HMAC_SHA1_80, non-MKI	DTLS-SRTP is not supported
	Control protocol for media transport	SRTCP (SRTCP-Mux recommended)	Using RTCP mux helps reduce number of required ports
	Supported Certification Authorities	Refer to Microsoft documentation	
	Transport for Media Bypass	ICE-lite (RFC5245) – recommended, <ul style="list-style-type: none"> <li>Client also has Transport Relays</li> </ul>	
Codecs	Audio codecs	<ul style="list-style-type: none"> <li>G711</li> <li>G722</li> <li>Silk (Teams clients)</li> <li>Opus (WebRTC clients) - Only if Media Bypass is used;</li> <li>G729</li> </ul>	
	Other codecs	<ul style="list-style-type: none"> <li>DTMF – Required</li> <li>Events 0-16</li> <li>CN</li> <li>Required narrowband and wideband</li> <li>RED – Not required</li> <li>Silence Suppression – Not required</li> </ul>	

### 3.4 Requirements to SIP messages “Invite” and “Options”

Microsoft Teams Hybrid Voice Connectivity interface has requirements for the syntax of SIP messages.

The section covers high-level requirements to SIP syntax of Invite and Options messages. The information can be used as a first step during troubleshooting when calls don't go through. From our experience most of the issues are related to the wrong syntax of SIP messages.

#### Terminology

- Recommended – not required, but to simplify the troubleshooting, it is recommended to configure as in examples as follow
- Must – strict requirement, the system does not work without the configuration of these parameters

### 3.5 Requirements for “INVITE” messages syntax

Picture 1 Example of INVITE message

```
INVITE sip:+17814437382@sip.pstnhub.microsoft.com:5061;user=phone;transport=tls SIP/2.0
Via: SIP/2.0/TLS 155.212.214.172:5061;branch=z9hG4bKndcs1720d08dhhs5s8g0.1
Max-Forwards: 45
From:<sip:+17657601680@oracleesbc2.woodgrovebank.us:5060;user=phone>;tag=af50c97a0a020200
To:<sip:+17814437382@sip.pstnhub.microsoft.com:5060;user=phone>
Call-ID: 1-af50c97a0a020200.2e95886d@68.68.117.67
CSeq: 2 INVITE
Contact:<sip:7657601680@oracleesbc2.woodgrovebank.us:5061;user=phone;transport=tls>;sip.ice
Allow: ACK, BYE, CANCEL, INVITE, OPTIONS, PRACK, REFER
User-Agent: Oracle ESBC
Supported: 100rel,replaces
Content-Type: application/sdp
```

#### 1. Request-URI

The recommendation is to set the Global FQDN name of the direct routing, in URI hostname when sending calls to Hybrid Voice Connectivity interface.

Syntax: INVITE sip: <phone number>@<Global FQDN > SIP/2.0

#### 2. From and To headers

**Must:** When placing calls to Teams Hybrid Voice Connectivity Interface “FROM” header MUST have SBC FQDN in URI hostname:

Syntax: From:sip: <phone number>@<FQDN of the SBC>;tag=....

If the parameter is not set correctly, the calls are rejected with “403 Forbidden” message.

**Recommended:** When placing calls to Teams Hybrid Voice Connectivity Interface “To” header have SBC FQDN in URI hostname of the Syntax: To: INVITE sip: <phone number>@<FQDN of the SBC>

#### 3. Contact

Must have the SBC FQDN for media negotiation. Syntax: Contact: <phone number>@<FQDN of the SBC>:<SBC Port>;<transport type>

The above requirements are automatically fulfilled in the referenced build of the software.

### 3.6 Requirements for “OPTIONS” messages syntax

Picture 2 Example of OPTIONS message

```
OPTIONS sip:sip.pstnhub.microsoft.com:5061;transport=tls SIP/2.0
Via: SIP/2.0/TLS 155.212.214.172:5061;branch=z9hG4bKk5ilpo00cobbgo9614h0
Call-ID: 98980084af15b946c779c9873165808f020000khp2@155.212.214.172
To: sip:ping@sip.pstnhub.microsoft.com
From: <sip:ping@oracleSBC2.woodgrovebank.us>;tag=db4ec94e7d8227d305c068e7a408a6a0000khp2

Content-Length: 0
Contact: <sip:ping@oracleSBC2.woodgrovebank.us:5061;transport=tls>
Record-Route: <sip:oracleSBC2.woodgrovebank.us>
```

#### 1. From header

When sending OPTIONS to Teams Hybrid Voice Connectivity Interface “FROM” header MUST have SBC FQDN in URI hostname:

Syntax: From: sip: <phone number>@<FQDN of the SBC>;tag=....

If the parameter is not set correctly, the OPTIONS are rejected with “403 Forbidden” message.

#### 2. Contact.

When sending OPTIONS to Teams Hybrid Voice Connectivity Interface “Contact” header should have SBC FQDN in URI hostname along with Port & transport parameter set to TLS.

Syntax: Contact: sip: <FQDN of the SBC:port;transport=tls> If the parameter is not set correctly, outbound OPTIONS won't be sent by Teams

The above requirements are automatically fulfilled in the referenced build of the software.

### 3.7 Validated Oracle version

Oracle conducted tests with Oracle SBC SCZ8.3 software – this software with the configuration listed below can run on any of the following products:

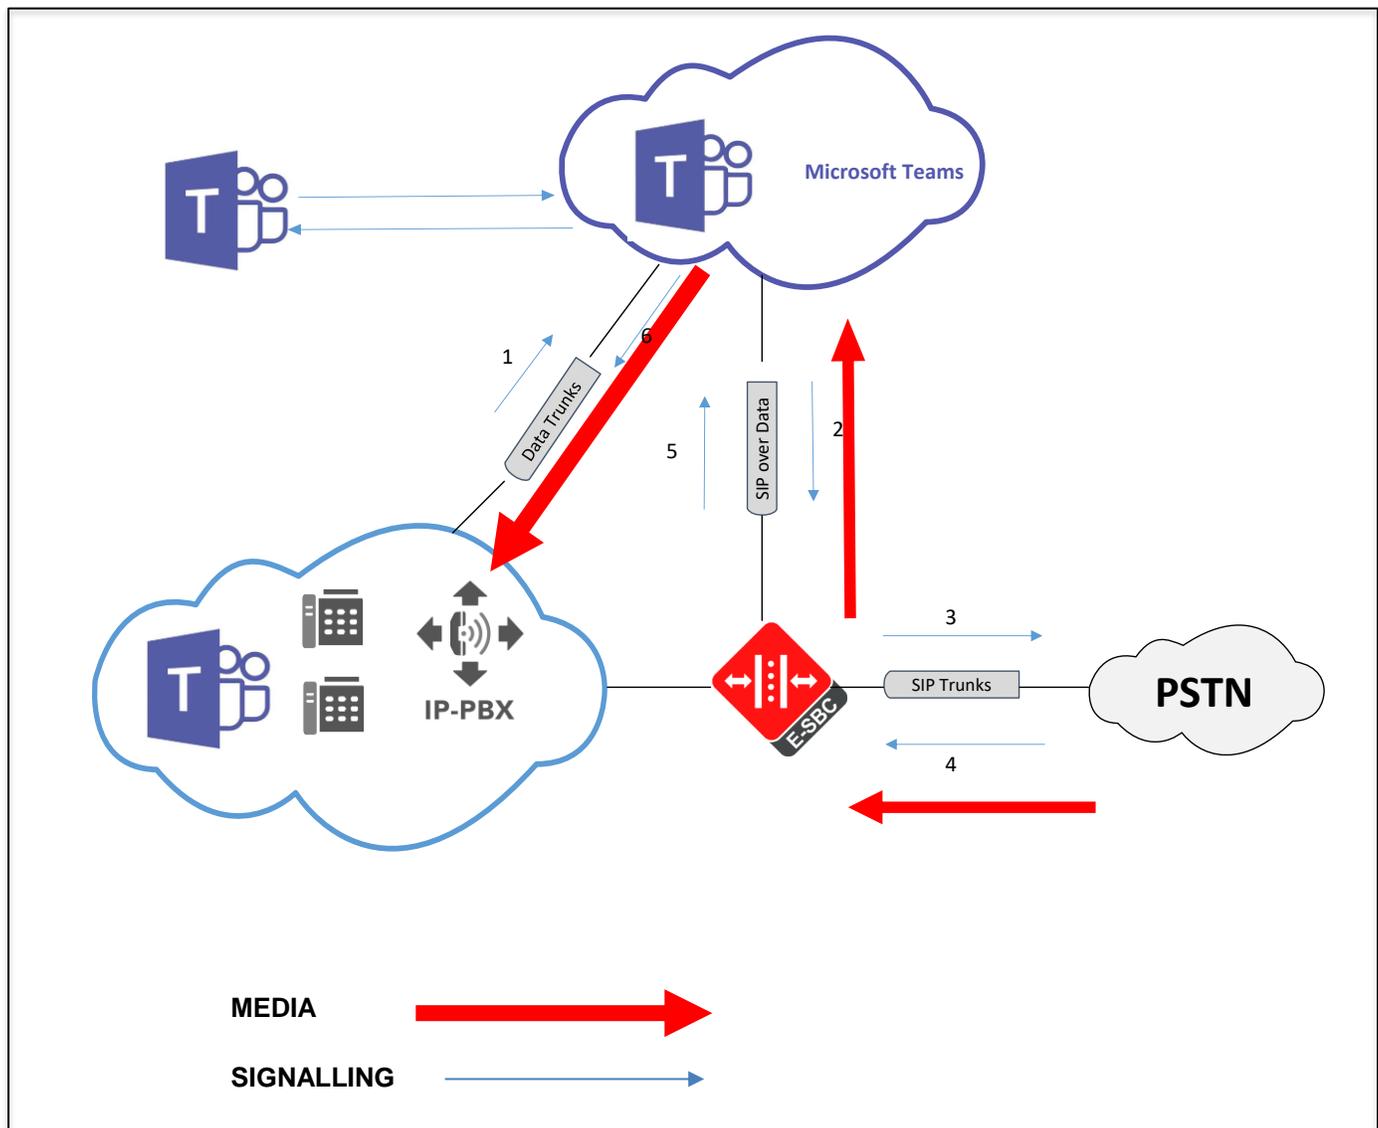

- AP 1100
- AP 3900
- AP 4600
- AP 6350
- AP 6300
- VME

Here Release SCZ830p7 is the software version used. Please upgrade to SCZ830p7 before configuring Oracle SBC for MS Teams.

## 4 Configuring the SBC

This chapter provides step-by-step guidance on how to configure Oracle SBC for interworking with Microsoft Teams Direct Routing Interface with Non -Media Bypass.

The Figure 1 below shows the connection topology example.

*Figure :1: Signaling & media flow with media-bypass disabled*

There are several connection entities on the picture:

- Enterprise network consisting of an IP-PBX and Teams client
- Microsoft Teams Direct Routing Interface on the WAN
- SIP trunk from a 3rd party provider on the WAN

These instructions cover configuration steps between the Oracle SBC and Microsoft Teams Direct Routing Interface. The interconnection of other entities, such as connection of the SIP trunk, 3rd Party PBX and/or analog devices are not covered in this instruction. The details of such connection are available in other instructions produced by the vendors of retrospective components.

## 5 New SBC configuration

If the customer is looking to setup a new out of the box Oracle SBC with Microsoft teams, please follow the section below.

### 5.1 Establishing a serial connection to the SBC

Connect one end of a straight-through Ethernet cable to the front console port (which is active by default) on the SBC and the other end to console adapter that ships with the SBC, connect the console adapter (a DB-9 adapter) to the DB-9 port on a workstation, running a terminal emulator application such as PuTTY. Start the terminal emulation application using the following settings:

- Baud Rate=115200
- Data Bits=8
- Parity=None
- Stop Bits=1
- Flow Control=None

Power on the SBC and confirm that you see the following output from the boot-up sequence

```
Starting tLemd...
Starting tServiceHealth...
Starting tCollect...
Starting tAtcpd...
Starting tAsctpd...
Starting tMbcd...
Starting tCommMonitord...
Starting tFpd...
Starting tAlgd...
Starting tRadd...
Starting tEbmd...
Starting tSipd...
Starting tH323d...
Starting tIPTd...
Starting tSecured...
Starting tAuthd...
Starting tCerd...
Starting tIked...
Starting tTscfd...
Starting tAppWeb...
Starting tauditd...
Starting tauditpusher...
Starting tSnmpd...
Starting tIFMIBd...
Start platform alarm...
Starting display manager...
Initializing /opt/ Cleaner
Starting tLogCleaner task
Bringing up shell...
password secure mode is enabled
Admin Security is disabled
Starting SSH...
SSH Cli init: allocated memory for 5 connections
```

Enter the default password to log in to the SBC. Note that the default SBC password is “acme” and the default super user password is “packet”.

Both passwords have to be changed according to the rules shown below.

```
Password:
%
% Only alphabetic (upper or lower case), numeric and punctuation
% characters are allowed in the password.
% Password must be 8 - 64 characters,
% and have 3 of the 4 following character classes :
%   - lower case alpha
%   - upper case alpha
%   - numerals
%   - punctuation
%
Enter New Password:
Confirm New Password:

Password is acceptable.
```

Now set the management IP of the SBC by setting the IP address in bootparam.to access bootparam. Go to Configure terminal->bootparam.

Note: There is no management IP configured by default.

```
PE-6300-1(configure)# bootparam

',' = clear field; '-' = go to previous field; q = quit

Boot File           : /boot/nnSCZ830p7.bz
IP Address          : 172.18.255.115
VLAN                :
Netmask             : 255.255.0.0
Gateway             : 172.18.0.1
IPv6 Address        :
IPv6 Gateway        :
Host IP             :
FTP username        : vxftp
FTP password        : vxftp
Flags               :
Target Name         : PE-6300-1
Console Device      : COM1
Console Baudrate    : 115200
Other                :

NOTE: These changed parameters will not go into effect until reboot.
Also, be aware that some boot parameters may also be changed through
PHY and Network Interface Configurations.

PE-6300-1(configure)# █
```

Setup product type to Enterprise Session Border Controller as shown. To configure product type, type in setup product in the terminal.

```
PE-6300-1# setup product
```

```
-----

## 5.2 Configure SBC using Web GUI

In this app note, we configure SBC using the WebGUI.

The WebGUI can be accessed through the url `https://<SBC_MGMT_IP>`. The username and password is the same as that of CLI.

Go to Configuration as shown below, to configure the SBC.

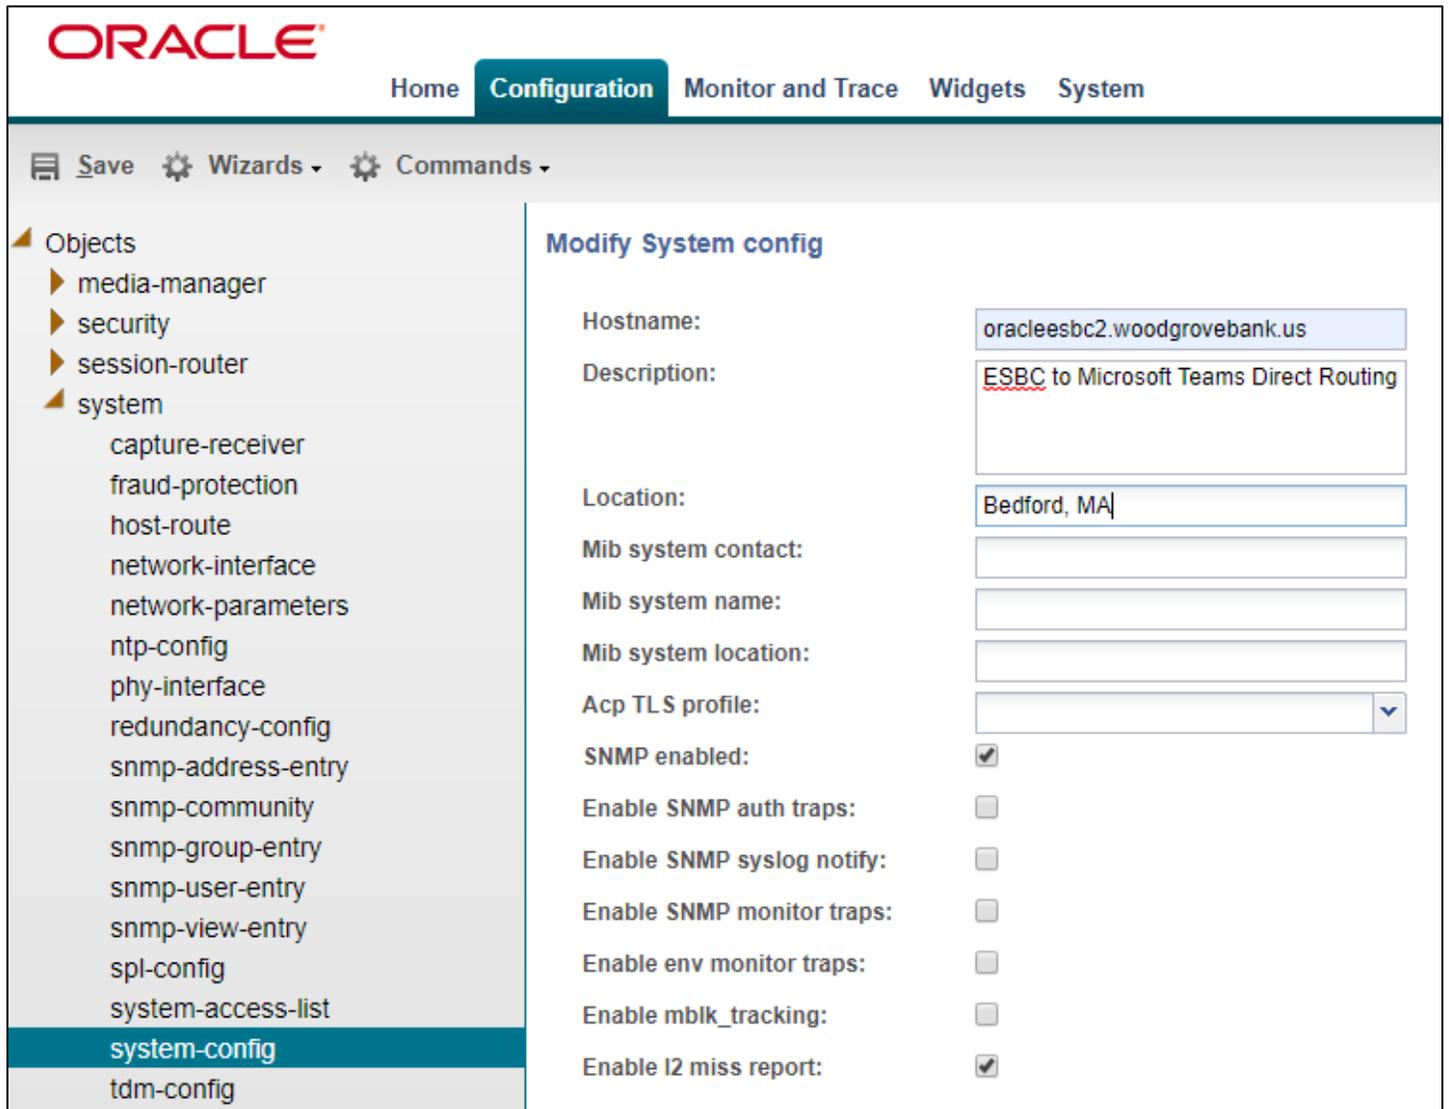

Kindly refer to the GUI User Guide [https://docs.oracle.com/en/industries/communications/enterprise-session-border-controller/8.3.0/webgui/esbc\\_scz830\\_webgui.pdf](https://docs.oracle.com/en/industries/communications/enterprise-session-border-controller/8.3.0/webgui/esbc_scz830_webgui.pdf) for more information.

The expert mode is used for configuration.

*Tip: To make this configuration simpler, one can directly search the element to be configured, from the Objects tab available.*

## 5.3 Configure system-config

Go to system->system-config

**ORACLE**

Home **Configuration** Monitor and Trace Widgets System

Save Wizards Commands

**Objects**

- media-manager
- security
- session-router

SNMP enabled:

Enable SNMP auth traps:

Enable SNMP syslog notify:

Enable SNMP monitor traps:

Enable env monitor traps:

Enable mblk\_tracking:

Enable I2 miss report:

## 5.4 Configure Physical Interface values

To configure physical Interface values, go to System->phy-interface.

You will first configure the slot 0, port 0 interface designated with the name s0p0. This will be the port plugged into your inside (connection to the PSTN gateway) interface. Teams is configured on the slot 0 port 1. Below is the screenshot for creating a phy-interface on s0p0

Create a similar interface for Teams as well from the WebGUI. The table below specifies the values for both teams and Trunk.

Parameter Name	Trunk(s0p0)	MSTeams(s0p1)
Slot	0	0
Port	0	1
Operation Mode	Media	Media

The screenshot shows the Oracle WebGUI interface for configuring a physical interface. The 'Modify Phy interface' form is displayed with the following values:

- Name: s0p0
- Operation type: Media
- Port: 0 (Range: 0..5)
- Slot: 0 (Range: 0..2)
- Virtual mac: (empty)
- Admin state:
- Auto negotiation:
- Duplex mode: FULL
- Speed: 100
- Wacom health score: 50 (Range: 0..100)

The left sidebar shows the navigation menu with 'phy-interface' selected under the 'system' category. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The user is logged in as 'admin'.

## 5.5 Configure Network Interface values

To configure network-interface, go to system->Network-Interface. Configure two interfaces, one for teams and one for PSTN trunk. Here, in the example the Teams network interface is shown. Configure the PSTN interface in the same manner.

The table below lists the parameters, to be configured for both the interfaces. The same is modified as per customer environment.

Parameter Name	Teams Network Interface	PSTN trunk Network interface
Name	s0p1	s0p0
Host Name	<a href="http://oracleesbc2.woodgrovebank.us">oracleesbc2.woodgrovebank.us</a>	
IP address	155.212.214.172	192.65.72.196
Netmask	255.255.255.0	255.255.255.0
Gateway	155.212.214.1	192.65.72.1
DNS-IP Primary	8.8.8.8	
DNS-domain	woodgrovebank.us	

*Please note: If running the GA release SCZ830m1p8A, hostname parameter in Network Interface is not mandatory, See [Appendix D](#) for additional details on how the hostname parameter is used with new features to help simplify your configuration by eliminating most, if not all required sip manipulations.*

*Tip: Configure ICMP IP and HIP IP only on the PSTN side. It is not advisable to configure the ICMP ip and HIP ip on the teams facing side because of inherent risks.*

## 5.6 Enable media manager

Media-manager handles the media stack required for SIP sessions on the SBC. Enable the media manager and configure the below option for generating rtcp reports.

- audio-allow-asymmetric-pt
- xcode-gratuitous-rtcp-report-generation (requires a reboot)

Go to Media-Manager->Media-Manager

The screenshot shows the Oracle SBC Configuration interface. The left sidebar lists various configuration objects, with 'media-manager' selected. The main panel displays the 'Modify Media manager' configuration page. The 'State' checkbox is checked. The following parameters are configured:

Parameter	Value	Range
Flow time limit:	86400	(Range: 0..4294967295)
Initial guard timer:	300	(Range: 0..4294967295)
Subsq guard timer:	300	(Range: 0..4294967295)
TCP flow time limit:	86400	(Range: 0..4294967295)
TCP initial guard timer:	300	(Range: 0..4294967295)
TCP subsq guard timer:	300	(Range: 0..4294967295)
Hnt rtcp:	<input type="checkbox"/>	
Algld log level:	NOTICE	
Mbcd log level:	NOTICE	

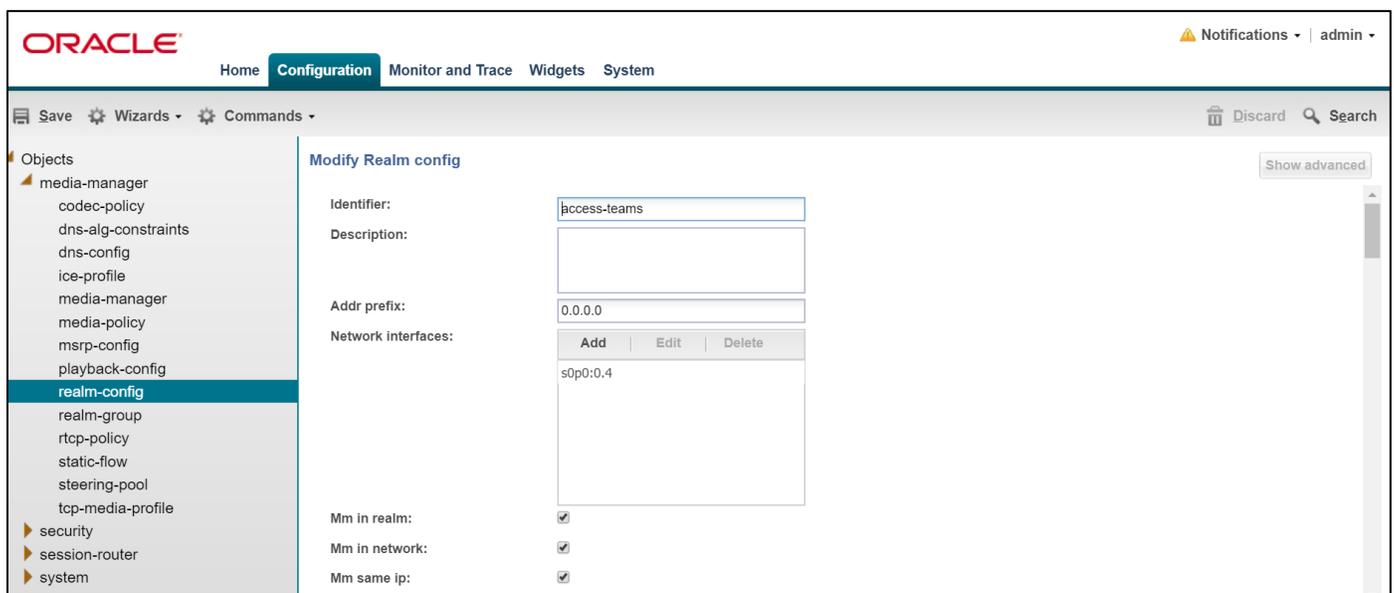

Options:

- audio-allow-asymmetric-pt
- xcode-gratuitous-rtcp-report-generation

## 5.7 Configure Realms

Navigate to realm-config under media-manager and configure a realm as shown below

Configure realm for teams as shown below

The screenshot shows the Oracle SBC Configuration interface. The left sidebar lists various configuration objects, with 'realm-config' selected. The main panel displays the 'Modify Realm config' configuration page. The 'Identifier' is set to 'access-teams'. The 'Addr prefix' is set to '0.0.0.0'. The 'Network interfaces' list contains 's0p0:0.4'. The 'Mm in realm', 'Mm in network', and 'Mm same ip' checkboxes are all checked.

Parameter	Value
Identifier:	access-teams
Description:	
Addr prefix:	0.0.0.0
Network interfaces:	s0p0:0.4
Mm in realm:	<input checked="" type="checkbox"/>
Mm in network:	<input checked="" type="checkbox"/>
Mm same ip:	<input checked="" type="checkbox"/>

Configure the realm, similarly for SIP Trunk

The screenshot shows the Oracle Configuration Assistant interface. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The left sidebar shows a tree view of objects, with 'realm-config' selected. The main area is titled 'Modify Realm config' and contains the following fields:

- Identifier: access-pstn
- Description: (empty)
- Addr prefix: 0.0.0.0
- Network interfaces: A table with columns 'Add', 'Edit', and 'Delete', containing the entry 's0p0:0.4'.
- Mm in realm:
- Mm in network:
- Mm same ip:

## 5.8 Enable sip-config

SIP config enables SIP handling in the SBC. Make sure the home realm-id, registrar-domain and registrar-host are configured. Also add the options to the sip-config as shown below.

To configure sip-config,

Go to Session-Router->sip-config.

- In options add max-udp-length =0.

The screenshot shows the Oracle Configuration Assistant interface for 'Modify SIP config'. The left sidebar shows a tree view of objects, with 'sip-config' selected. The main area contains the following fields:

- State:
- Dialog transparency:
- Home Realm ID: access-pstn
- Egress Realm ID: (empty)
- Nat mode: None
- Registrar domain: \*
- Registrar host: \*
- Registrar port: 5060 (Range: 0, 1025..65535)
- Init timer: 500 (Range: 0..4294967295)
- Max timer: 4000 (Range: 0..4294967295)
- Trans expire: 32 (Range: 0..4294967295)
- Initial inv trans expire: 0 (Range: 0..999999999)
- Invite expire: 180 (Range: 0..4294967295)

```

## 5.9 Configuring a certificate for SBC Interface

Microsoft Teams Direct Routing Interface only allows TLS connections from SBCs for SIP traffic with a certificate signed by one of the trusted certification authorities.

The step below describes how to request a certificate for SBC External interface and configure it based on the example of DigiCert. The process includes the following steps:

1. Create a certificate-record – “Certificate-record” are configuration elements on Oracle SBC which captures information for a TLS certificate – such as common-name, key-size, key-usage etc.

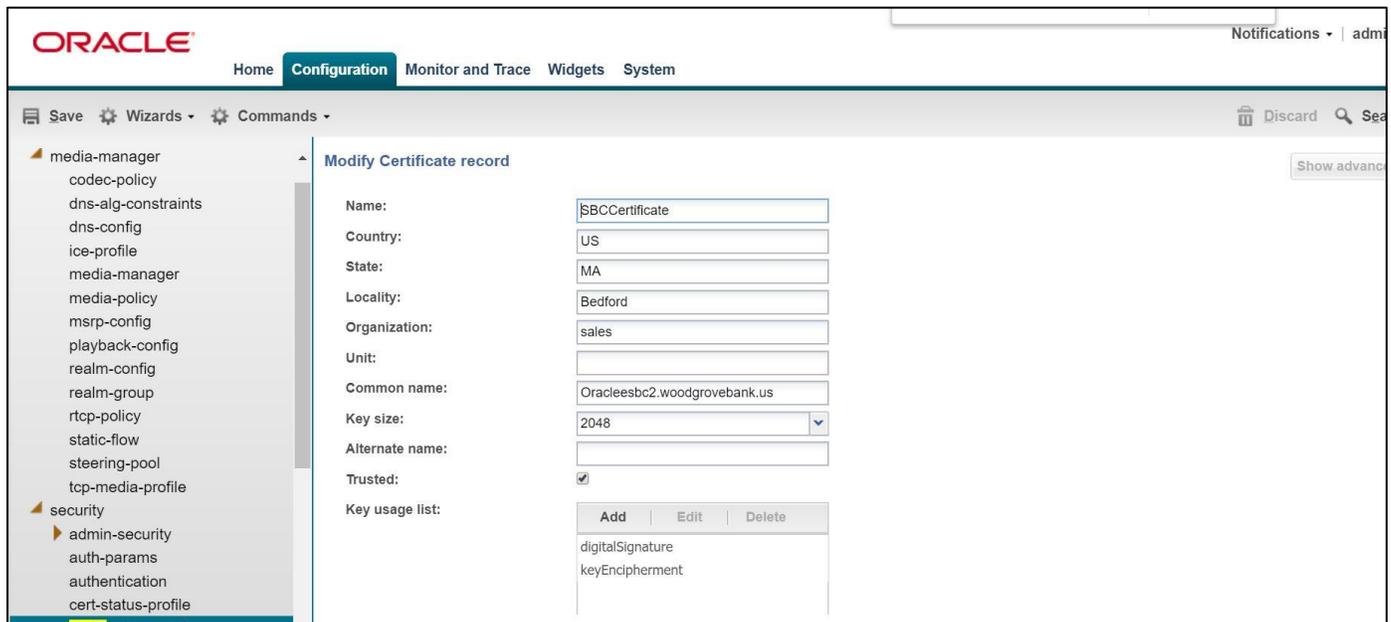

The following certificate-records are required on the Oracle SBC in order for the SBC to connect with Microsoft Teams

- SBC – 1 certificate-record assigned to SBC
  - Root – 1 certificate-record for root cert
  - Intermediate – 1 certificate-record for intermediate (this is optional – only required if your server certificate is signed by an intermediate)
2. Generate a Certificate Signing Request (CSR) and obtain the certificate from a supported Certification Authority
  3. Deploy the SBC and Root/Intermediary certificates on the SBC

## 5.10 SBC Certificate Creation

### 5.10.1 Step 1 – Creating the SBC certificate record

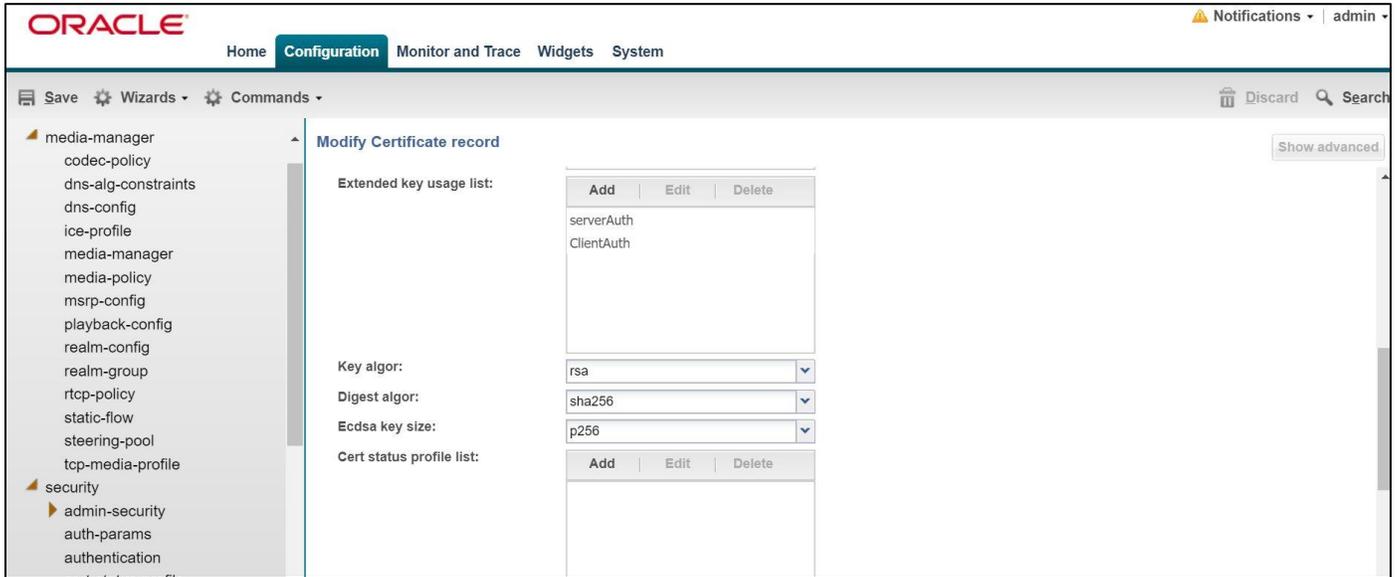

Go to security->Certificate Record and configure a certificate for SBC as shown below.

The screenshot displays the Oracle SBC Configuration web interface. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The left sidebar shows a tree view with 'security' expanded. The main content area is titled 'Modify Certificate record' and contains the following fields:

- Name: SBCCertificate
- Country: US
- State: MA
- Locality: Bedford
- Organization: sales
- Unit:
- Common name: Oracleesbc2.woodgrovebank.us
- Key size: 2048
- Alternate name:
- Trusted:
- Key usage list: digitalSignature, keyEncipherment

Buttons for 'Add', 'Edit', and 'Delete' are visible above the key usage list.

### 5.10.2 Step 2 – Generating a certificate signing request for SBC certificate

- Select the certificate and generate certificate on clicking the “Generate” command.
- Please copy/paste the text that gets printed on the screen as shown below and upload to your CA server for signature.

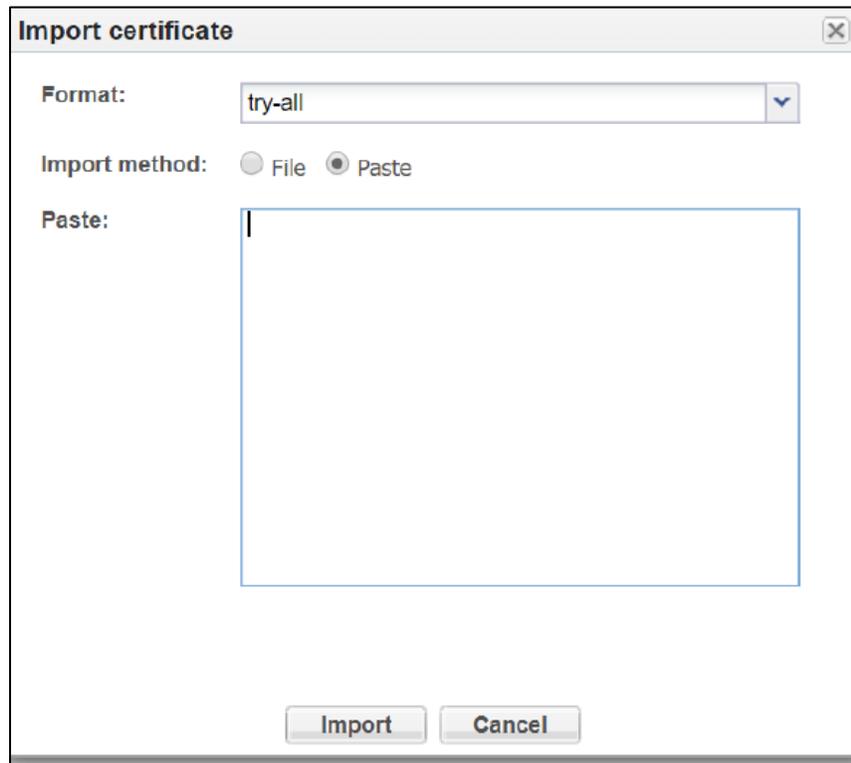

*Also, note that a save/activate is required*

### 5.10.3 Step 3 – Deploy the SBC certificate

Once certificate signing requests have been completed – import the signed certificate to the SBC.  
Copy paste the certificate.

Once done, issue save/activate from the WebGUI

The image shows a web-based dialog box titled "Import certificate". It features a close button in the top right corner. The "Format" field is a dropdown menu currently showing "try-all". Below it, the "Import method" section has two radio buttons: "File" and "Paste", with "Paste" being the selected option. A large, empty text area labeled "Paste:" is provided for entering the certificate data. At the bottom of the dialog, there are two buttons: "Import" and "Cancel".

### 5.11 Root and Intermediate Certificates Creation

There are 3 more certificates that are required for direct routing.

-BaltimoreRoot: This certificate is always required for MS Teams.

This certificate can be downloaded from <https://cacert.omniroot.com/bc2025.pem>

The serial number of this certificate is 0x20000b9.

*Note :The certificate should be in .pem format.*

-DigiCertRoot

-DigiCertInter

### 5.11.1 Step 1 - Creating the root and intermediate certificates on SBC

Go to security->Certificate Record and create the certificate with parameters as shown. . Modify the configuration according to the certificates in your environment.

Parameter	DigicertInter	BaltimoreRoot	DigiCertRoot
Common-name	DigiCert SHA2 Secure Server CA	Baltimore CyberTrust Root	DigiCert Global Root CA
Key-size	2048	2048	2048
Key-usage-list	digitalSignature keyEncipherment	digitalSignature keyEncipherment	digitalSignature keyEncipherment
Extended-key-usage-list	serverAuth	serverAuth	serverAuth
key-algor	rsa	rsa	rsa
digest-algor	sha256	sha256	sha256

### 5.11.2 Step 2 - Deploying the Root and Intermediate certificates on SBC

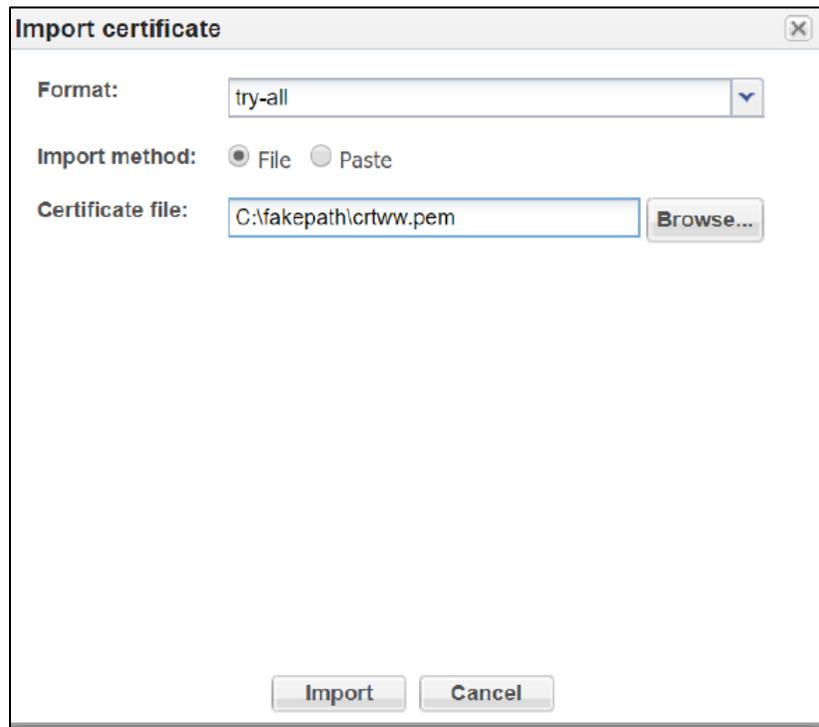

All the root and intermediate certificates have to imported to SBC.

The root and intermediate certificates can be imported into the SBC only in the .pem format.

Note: The BaltimoreRoot certificate downloaded in Step1 can be directly imported as shown.

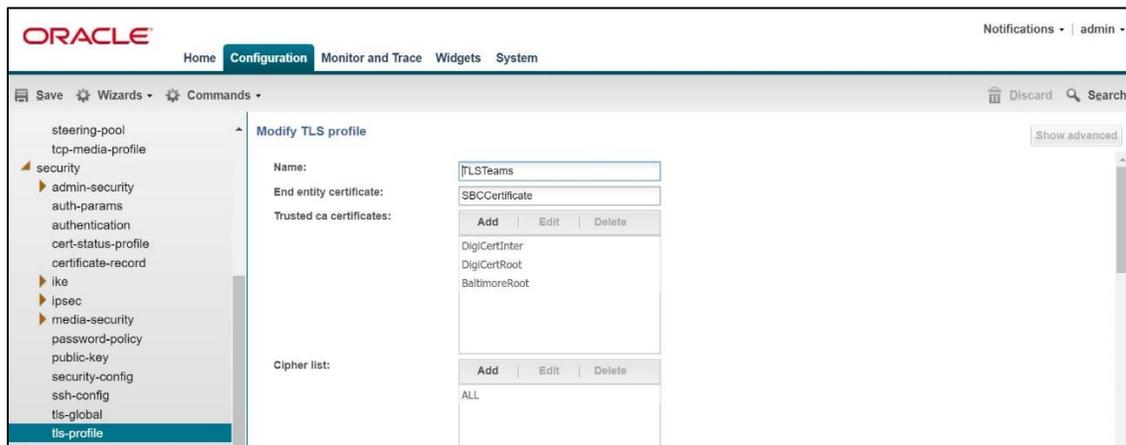

Click on the certificate and select Import.

The below screen appears. Make sure your file is in .pem format and upload.

## 5.12 TLS-Profile

A TLS profile configuration on the SBC allows for specific certificates to be assigned. Go to security-> TLS-profile config element and configure the tls-profile as shown below

- steering-pool
- tcp-media-profile
- security
  - admin-security
  - auth-params
  - authentication
  - cert-status-profile
  - certificate-record
  - ike
  - ipsec
  - media-security
  - password-policy
  - public-key
  - security-config
  - ssh-config
  - tls-global
  - tls-profile**
  - session-router
  - system

## 5.13 Creating a sip-interface to communicate with Microsoft Teams

Set the following configuration elements – ensure that the IP address allocated to the SIP interface is the FQDN resolvable address. i.e. if you issue command nslookup from another computer, “oracleesbc2.woodgrovebank.us” – it should resolve to 155.212.214.172.

Note that the IP should be publicly routable IP address. To configure sip-interface, Go to Session-Router->Sip-Interface.

Note:

- -Tls-profile needs to match the name of the tls-profile previously created
- -Set allow-anonymous to agents-only to ensure traffic to this sip-interface only comes from Teams server.

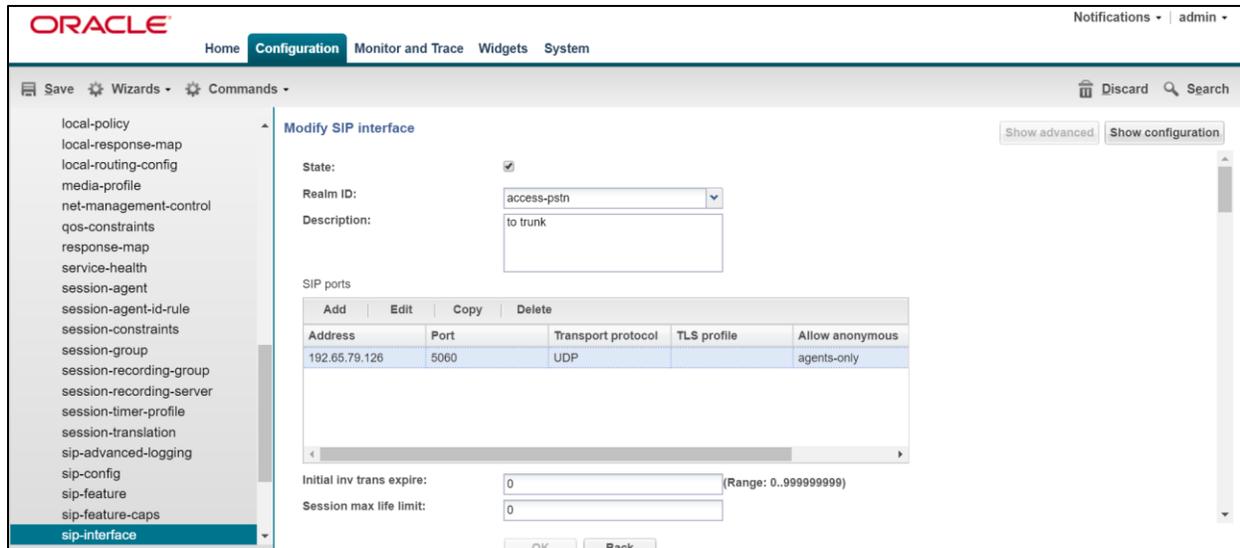

The screenshot shows the Oracle Session Router configuration interface. The top navigation bar includes 'ORACLE', 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The 'Configuration' tab is active. On the left, a sidebar lists various configuration categories, with 'sip-feature' selected. The main area is titled 'Modify SIP interface' and contains the following fields and controls:

- State:** A checked checkbox.
- Realm ID:** A dropdown menu with 'access-teams' selected.
- Description:** An empty text input field.
- SIP ports:** A table with columns: Address, Port, Transport protocol, TLS profile, and Allow anonymous. It contains one entry: 155.212.214.172, 5061, TLS, TLSTeams, agents-only.
- Initial inv trans expire:** A text input field with '0' and a range '(Range: 0..99999999)'.

Buttons for 'Show advanced' and 'Show configuration' are located in the top right of the configuration area.

## 5.14 Configure sip-interface to communicate with SIP Trunk

Similarly configure the sip-interface for sip-trunk, according to your environment.

The screenshot shows the Oracle SBC configuration interface. The left sidebar lists various configuration categories, with 'sip-interface' selected. The main area is titled 'Modify SIP interface' and contains the following fields and table:

State:

Realm ID:

Description:

SIP ports

Add   Edit   Copy   Delete				
Address	Port	Transport protocol	TLS profile	Allow anonymous
192.65.79.126	5060	UDP		agents-only

Initial inv trans expire:  (Range: 0..999999999)

Session max life limit:

Buttons: OK, Back

Once sip-interface is configured – the SBC is ready to accept traffic on the allocated IP address. Now configure where the SBC sends the outbound traffic.

## 5.15 Configure session-agent

Session-agents are config elements which are trusted agents who can send/receive traffic from the SBC with direct access to trusted data path. Configure the session-agent for Teams with the following parameters. Go to session-router->Session-Agent.

- hostname to “sip.pstnhub.microsoft.com”
- port 5061
- realm-id – needs to match the realm created for teams – in this case – “Access-teams”
- transport set to “StaticTLS”
- refer-call-transfer set to enabled
- ping-method – send OPTIONS message to Microsoft to check health
- ping-interval to 30 secs

Follow above steps to create 2 more sessions for:

- sip2.pstnhub.microsoft.com
- sip3.pstnhub.microsoft.com
- sip-all.pstnhub.microsoft.com

*Note: Please note that all signaling SHOULD only point to sip/sip2/sip3.pstnhub.microsoft.com – no signaling should be sent to sip-all.pstnhub.microsoft.com FQDN. The sip-all.pstnhub.microsoft.com FQDN is only used for longer DNS TTL value*

Hostname	IP address	Port	State	App protocol	Realm ID	Description
ATTTrunk	68.68.117.67	5060	disabled	SIP	access-pstn	
sip-all.pstnhub.micro...		5061	enabled	SIP	access-teams	
sip.pstnhub.microsoft...		5061	enabled	SIP	access-teams	
sip2.pstnhub.microso...		5061	enabled	SIP	access-teams	
sip3.pstnhub.microso...		5061	enabled	SIP	access-teams	

## 5.16 Create a Session Agent Group

A session agent group allows the SBC to create a load balancing model. Go to Session-Router->Session-Group.

The screenshot displays the Oracle SBC Configuration interface. The top navigation bar includes 'Home', 'Configuration' (selected), 'Monitor and Trace', 'Widgets', and 'System'. Below the navigation bar, there are icons for 'Save', 'Wizards', and 'Commands'. On the left side, a tree view under 'Objects' shows the path: session-router > session-agent. The main area is titled 'Modify Session group' and contains the following configuration fields:

- Group name:** TeamsGrp
- Description:** (empty text area)
- State:**
- App protocol:** SIP
- Strategy:** Hunt
- Dest:** A list of destinations with 'Add', 'Edit', and 'Delete' buttons above it:
  - sip.pstnhub.microsoft.com
  - sip2.pstnhub.microsoft.com
  - sip3.pstnhub.microsoft.com
- Trunk group:** A list of trunk groups with 'Add', 'Edit', and 'Delete' buttons above it (currently empty).
- Sag recursion:**
- Stop sag recurse:** 401,407,480

## 5.17 Configure local-policy

Local policy config allows for the SBC to route calls from one end of the network to the other based on routing criteria. To configure local-policy, go to Session-Router->local-policy. In order for inbound calls from Teams to be routed to a SIP Trunk following config is required:

The screenshot shows the Oracle Session Manager configuration interface. The left sidebar lists various configuration categories, with 'local-policy' selected. The main area is titled 'Modify Local policy' and contains three input sections: 'From address:', 'To address:', and 'Source realm:'. Each section has an 'Add', 'Edit', and 'Delete' button above a text input field. The 'From address:' and 'To address:' fields currently contain an asterisk (\*). The 'Source realm:' field is empty. At the top right, there are 'Show advanced' and 'Show configuration' buttons. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'.

This screenshot shows the 'Modify Local policy' configuration page with more details. The left sidebar is expanded to show 'local-policy' and its sub-items. The main area includes a 'Description:' text field, a 'State:' checkbox (checked), and a 'Policy priority:' dropdown menu set to 'none'. Below these is a 'Policy attributes' table with columns for 'Next hop', 'Realm', 'Action', 'Terminate recursion', and 'Cost'. The table contains one row with the following data:

Next hop	Realm	Action	Terminate recursion	Cost
ATTTrunk	access-pstn	none	disabled	0

At the top right, there are 'Show advanced' and 'Show configuration' buttons. The top navigation bar is the same as in the previous screenshot.

The screenshot shows the Oracle SBC Configuration interface. The left sidebar lists various configuration categories, with 'local-policy' selected. The main area is titled 'Modify Local policy / policy attribute' and contains the following fields:

- Next hop: ATT Trunk (dropdown)
- Realm: access-pstn (dropdown)
- Action: none (dropdown)
- Terminate recursion:
- Cost: 0 (text input, Range: 0..999999999)
- State:
- App protocol: (dropdown)
- Lookup: single (dropdown)
- Next key: (text input)

The above local policy config is allowing any DID from teams that lands on the SBC to be routed to ATT Trunk via realm access-pstn, where the next hop is the IP address of the ATT Trunk.  
 A second local policy is required to be configured to route outbound calls to Teams from access-pstn, configure it as follows:

The screenshot shows the Oracle SBC Configuration interface for a second local policy. The left sidebar lists various configuration categories, with 'local-policy' selected. The main area is titled 'Modify Local policy' and contains the following fields:

- From address: (text input with 'Add', 'Edit', and 'Delete' buttons)
- To address: (text input with 'Add', 'Edit', and 'Delete' buttons)
- Source realm: (text input with 'Add', 'Edit', and 'Delete' buttons)

Next key:

The above local policy will route calls from Access-pstn to access-teams if they match the routing criteria.

## 5.18 Configure Media Profile & Codec Policy

The Oracle® Session Border Controller (SBC) uses codec policies to describe how to manipulate SDP messages as they cross the SBC. The SBC bases its decision to transcode a call on codec policy configuration and the SDP. Each codec policy specifies a set of rules to be used for determining what codecs are retained, removed, and how they are ordered within SDP.

Note: this is an optional config – configure codec policy only if deemed required

Some SIP trunks may have issues with the codecs being offered by Microsoft teams, so following codec policy may be required in order for the calls to work flawlessly.

SILK offered by Microsoft teams is using a payload type which is different than usual. Configure the media-profile as shown below, go to Session-Router->Media-profile

Name	<input type="text" value="SILK"/>	
Subname	<input type="text" value="narrowband"/>	
Media Type	<input type="text" value="audio"/>	
Payload Type	<input type="text" value="103"/>	
Transport	<input type="text" value="RTP/AVP"/>	
Clock Rate	<input type="text" value="8000"/>	( Range: 0..4294967295 )
Req Bandwidth	<input type="text" value="0"/>	( Range: 0..999999999 )
Frames Per Packet	<input type="text" value="0"/>	( Range: 0..256 )
Parameters	<input type="text"/>	

Configure media profiles for SILK codec like shown below

Parameters	SILK-1	SILK-2
Subname	narrowband	wideband
Payload-Type	103	104
Clock-rate	8000	16000

Create a codec-policy addCN, to add comfort noise towards Teams and apply it on the realm for Teams, Access-teams.

The screenshot shows the Oracle Configuration Assistant interface. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The 'Configuration' tab is active. On the left, a tree view shows 'Objects' with 'media-manager' expanded to 'codec-policy'. The main area is titled 'Modify Codec policy' and shows the configuration for a policy named 'addCN'. The 'Allow codecs:' section contains a table with two entries: 'SILK:no' and 'G729:no'. The 'Add codecs on egress:' section contains a table with one entry: 'CN'. Buttons for 'Add', 'Edit', and 'Delete' are visible for both sections. A 'Show advanced' button is in the top right.

This screenshot shows the same 'Modify Codec policy' page for 'addCN', but with advanced settings expanded. The 'Packetization time:' is set to 20 (Range: 0..4294967295). 'Force ptime:' and 'Secure dtmf cancellation:' are unchecked. 'Dtmf in audio:' is set to 'disabled'. The 'Tone detection:' section has an 'Add' button. 'Tone detect renegotiate timer:' is set to 500 (Range: 50..32000). 'Reverse fax tone detection reinvite:' and 'Evrc tty baudot transcode:' are unchecked. 'Fax single m line:' is set to 'disabled'. The 'Show advanced' button is visible in the top right.

The screenshot shows the Oracle SBC Configuration web interface. At the top, there is a navigation bar with 'ORACLE' logo, 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. A 'Notifications' dropdown and 'admin' user name are visible in the top right. Below the navigation bar, there are tabs for 'Save', 'Wizards', and 'Commands'. The left sidebar shows a tree view of objects, with 'realm-config' highlighted. The main content area is titled 'Modify Realm config' and contains several configuration fields:

- Upuuns: [text input]
- Spl options: [text input]
- Delay media update:
- Refer call transfer: [dropdown menu, value: disabled]
- Hold refer reinvoke:
- Refer notify provisional: [dropdown menu, value: none]
- Dyn refer term:
- Codec policy: [dropdown menu, value: addCN]
- Codec manIP in realm:
- Codec manIP in network:
- RTCP policy: [dropdown menu, value: rtcpGen]
- Constraint name: [dropdown menu]

## 5.19 Configure sip-manipulations

## 5.20 Teamsoutmanip

In order for calls to be presented to Microsoft teams or SIP trunk from the SBC – the SBC would require alterations to the SIP signaling natively created. Following are manipulations required on the SBC in order for to present signaling to Microsoft Teams:

- Countrycode– formats the Request-URI as per MS Teams standards
- Change\_fromip\_fqdn , Change\_to\_userandhost – changes the From and To header according to MS requirements
- Addcontactheaderinoptions – Add a new Contact header to OPTIONS message
- Recordroute – Add a new Record-Route header to OPTIONS message
- Alter\_contact-changes the contact header as per MS Teams requirements
- Adduseragent – adds the SBC information in the User-Agent header,if the User-agent is not present already.
- Modifyuser – Modifies the SBC information in the User-Agent header,if the User-agent is present already.
- [Reqsendonlytoinactive](#) - Modifies the send only attribute of SDP to inactive in the request
- [Replyrecvonlytoinactive](#) - Modifies the recv only attribute of SDP to inactive in the reply

The following sip-manipulation called Teamsoutmanip is configured as out-manipulationid to make the changes mentioned above. To configure sip-manipulations, go to session-router->sip-manipulation

*Note: If running the GA release, SCZ830m1p8A, please see [Appendix D](#) prior to configuring sip manipulations in your Oracle SBC. This appendix outlines how new features added to the GA release will help simplify your configuration by eliminating the need for most, if not all required sip manipulations.*

- New value: \*1\*+s

A 'Show advanced' button is located in the top right corner of the configuration area.

## 5.20.4 Addcontactheaderinoptions

It is configured as a header rule in the sip-manipulation Teamsoutmanip. Here the contact is changed to "< sip:ping@oracleSBC.woodgrovebank.us:5067;transport=tls>", according to MS Team requirements.

The screenshot shows the Oracle Configuration Assistant interface. The top navigation bar includes 'ORACLE', 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. On the right, there are 'Notifications' and 'admin' links. Below the navigation bar, there are 'Save', 'Wizards', and 'Commands' options. A search bar with 'Discard' and 'Search' icons is also present.

The left sidebar shows a tree view of objects under 'sip-manipulation', including 'sip-manipulation' and 'sip-monitoring'. The 'sip-manipulation' object is selected.

The main content area is titled 'Add SIP manipulation / header rule'. It contains the following configuration fields:

- Name: Addcontactheaderinoptions
- Header name: Contact
- Action: add
- Comparison type: case-sensitive
- Msg type: out-of-dialog
- Methods: Add | Edit | Delete
- Match value: (empty)
- New value: < sip:ping@oracleSBC.woodgrovebank.us:5067;transport=tls>
- CfgRules: (empty)

A 'Show advanced' button is located in the top right corner of the configuration area. At the bottom, there are 'OK' and 'Back' buttons.

## 5.20.5 Recordroute

It is configured as a header rule in the sip-manipulation Teamsoutmanip. Here Record-route is added to the OPTIONS message "<sip:oracleesbc2.woodgrovebank.us>"

The screenshot displays the Oracle Configuration Manager interface for configuring a SIP manipulation header rule. The left sidebar shows a tree view of objects, with 'sip-manipulation' selected. The main area is titled 'Add SIP manipulation / header rule' and contains the following configuration fields:

- Name:** Recordroute
- Header name:** Record-Route
- Action:** add
- Comparison type:** case-sensitive
- Msg type:** out-of-dialog
- Methods:** Add | Edit | Delete
- Match value:** (empty field)
- New value:** "<sip:oracleesbc2.woodgrovebank.us>"

The 'Methods' section shows a list of methods, with 'OPTIONS' selected. The 'Match value' field is empty, and the 'New value' field contains the SIP URI. The interface also includes a 'Show advanced' button and a 'Discard' button.

## 5.20.6 Alter\_contact

It is configured as a header rule in the sip-manipulation Teamsoutmanip. The contact header is changed according to MS Team requirements. The following element rule is added

- Changing the uri according to include the SBC uri (oracleesbc2.woodgrovebank.us)

The screenshot shows the Oracle Configuration interface for a SIP manipulation header rule. The configuration is as follows:

Name:	Alter_contact
Header name:	Contact
Action:	manipulate
Comparison type:	case-sensitive
Msg type:	any
Methods:	INVITE
Match value:	
New value:	

The left sidebar shows a tree view of configuration objects, with 'session-group' selected.

The screenshot shows the Oracle Configuration interface for a SIP manipulation header rule. The configuration is as follows:

Match value:	
New value:	

The left sidebar shows a tree view of configuration objects, with 'sip-manipulation' selected.

Below the configuration fields, there is a table for CfgRules:

Name	Element type
Contact_ip	element-rule

The screenshot shows the Oracle configuration interface. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The 'Configuration' tab is active. On the left, a tree view shows the 'session-router' object expanded to 'sip-interface'. The main area is titled 'Add SIP manipulation / header rule / element rule' and contains the following configuration fields:

- Name: Contact\_ip
- Parameter name: contact\_ip
- Type: uri-host
- Action: replace
- Match val type: any
- Comparison type: case-sensitive
- Match value: (empty)
- New value: oracleesbc2.woodgrovebank.us

### 5.20.7 Adduseragent

It is configured as a header rule in the sip-manipulation Teamsoutmanip. It adds the user agent to the Invite message, if it is already not present in the invite from Siptrunk.

The screenshot shows the Oracle configuration interface. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The 'Configuration' tab is active. On the left, a tree view shows the 'sip-manipulation' object selected. The main area is titled 'Add SIP manipulation / header rule' and contains the following configuration fields:

- Name: Adduseragent
- Header name: User-Agent
- Action: add
- Comparison type: case-sensitive
- Msg type: out-of-dialog
- Methods:
 

Add	Edit	Delete
INVITE		
- Match value: (empty)
- New value: "Oracle ESBC"
- CfgRules: (empty)

## 5.20.8 Modifyuseragent

It is configured as a header rule in the sip-manipulation Teamsoutmanip. It modifies the user agent to the Invite message, according to MS Teams requirements.

The screenshot shows the Oracle Configuration interface for adding a SIP manipulation rule. The left sidebar lists various configuration objects, with 'sip-manipulation' selected. The main area is titled 'Add SIP manipulation / header rule' and contains the following fields:

- Name: Modifyuseragent
- Header name: User-Agent
- Action: manipulate
- Comparison type: case-sensitive
- Msg type: out-of-dialog
- Methods: A table with columns 'Add', 'Edit', and 'Delete'. The 'Add' column contains the text 'INVITE'.
- Match value: (empty text box)
- New value: (empty text box)
- CfgRules: (empty text box)

The screenshot shows the Oracle Configuration interface for modifying a SIP manipulation rule. The left sidebar lists various configuration objects, with 'sip-manipulation' selected. The main area is titled 'Modify SIP manipulation / header rule' and contains the following fields:

- Match value: (empty text box)
- New value: (empty text box)
- CfgRules: A table with columns 'Add', 'Edit', 'Copy', 'Delete', 'Move up', and 'Move down'. The table has two columns: 'Name' and 'Element type'. The first row contains the text 'user' under 'Name' and 'element-rule' under 'Element type'.

The screenshot shows the Oracle SBC Configuration interface. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The 'Configuration' tab is active. On the left, there is a tree view of objects under 'session-router'. The main area is titled 'Add SIP manipulation / header rule / element rule' and contains the following form fields:

Name:	<input type="text" value="user"/>
Parameter name:	<input type="text"/>
Type:	<input type="text" value="header-value"/>
Action:	<input type="text" value="add"/>
Match val type:	<input type="text" value="any"/>
Comparison type:	<input type="text" value="case-sensitive"/>
Match value:	<input type="text"/>
New value:	<input type="text" value="*Oracle ESBCT"/>

For configuring the following rules in Teamsoutmanip, click on the hyperlink below.

- [Reqsendonlytoinactive](#)
- [Replyrecvonlytoinactive](#)

## 5.21 Teamsinmanip

The following manipulation is configured to handle the SIP messages received inbound from Teams, Teamsinmanip.

- Respondoptions – to handle the OPTIONS locally
- Reqinactivetosendonly – replaces the inactive SDP attribute to sendonly in the request
- Replyinactivetorecvonly - replaces the inactive SDP attribute to rcvonly in the reply
- [Change183to180](#) –Changes 183 Session in Progress to 180 Ringing for ringback requirements

*Note: If running the GA release, SCZ830m1p8A, please see [Appendix D](#) prior to configuring sip manipulations in your Oracle SBC. This appendix outlines how new features added to the GA release will help simplify your configuration by eliminating the need for most, if not all required sip manipulations.*

## 5.21.1 Respondoptions

It is configured as a header-rule rule in the sip-manipulation Teamsinmanip. This handles the options locally.

The screenshot shows the Oracle configuration interface for adding a SIP manipulation rule. The interface includes a navigation menu on the left with categories like 'media-manager', 'security', and 'session-router'. The main area is titled 'Add SIP manipulation / header rule' and contains the following fields:

- Name: Respondoptions
- Header name: From
- Action: reject
- Comparison type: case-sensitive
- Msg type: request
- Methods: A table with columns 'Add', 'Edit', and 'Delete', and a row containing 'OPTIONS'.
- Match value: (empty field)
- New value: 200 OK
- CfgRules: (empty field)

Additional interface elements include 'Save', 'Wizards', 'Commands', 'Discard', and 'Search' buttons, and a 'Show advanced' button.

Please click on the hyperlink for the following rules applied on the Teamsinmanip manipulation.

## 5.22 Applying the teams SIP manipulations to Teams SIP Interface

Apply the above sip manipulations to sip-interface as shown below.

The screenshot shows the Oracle Configuration interface for the 'Modify SIP interface' task. The left sidebar lists various configuration categories, with 'sip-manipulation' selected. The main area contains the following configuration fields:

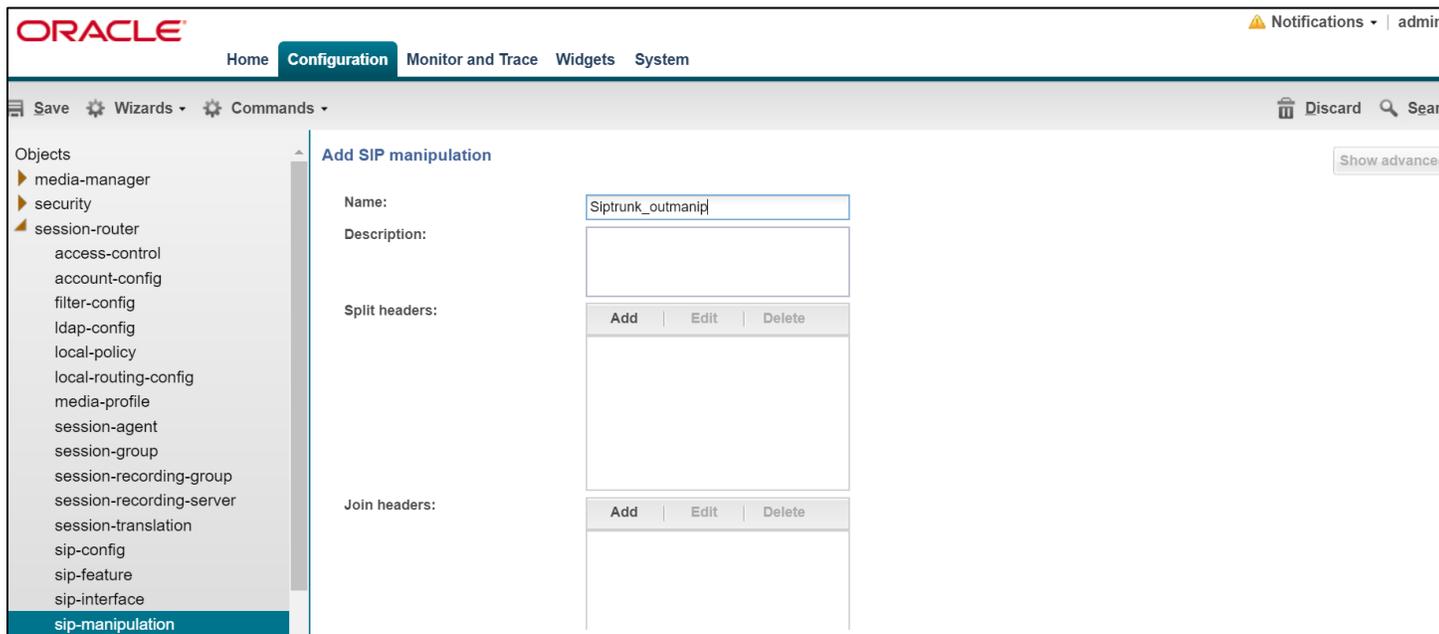

Field Name	Value	Range
Spl options:		
Trust mode:	all	
Max nat interval:	3600	(Range: 0..4294967295)
Stop recurse:	401,407	
Port map start:	0	(Range: 0, 1025..65535)
Port map end:	0	(Range: 0, 1025..65535)
In manipulationid:	Teamsinmanip	
Out manipulationid:	Teamsoutmanip	
SIP atcf feature:	<input type="checkbox"/>	
Rfc2833 payload:	101	(Range: 96..127)
Rfc2833 mode:	transparent	
Response map:		
Local response map:		
See anree feature:	<input type="checkbox"/>	

Buttons for 'Save', 'Wizards', 'Commands', 'Discard', 'Show advanced', and 'Show co' are visible. The 'sip-manipulation' category in the sidebar is highlighted in yellow.

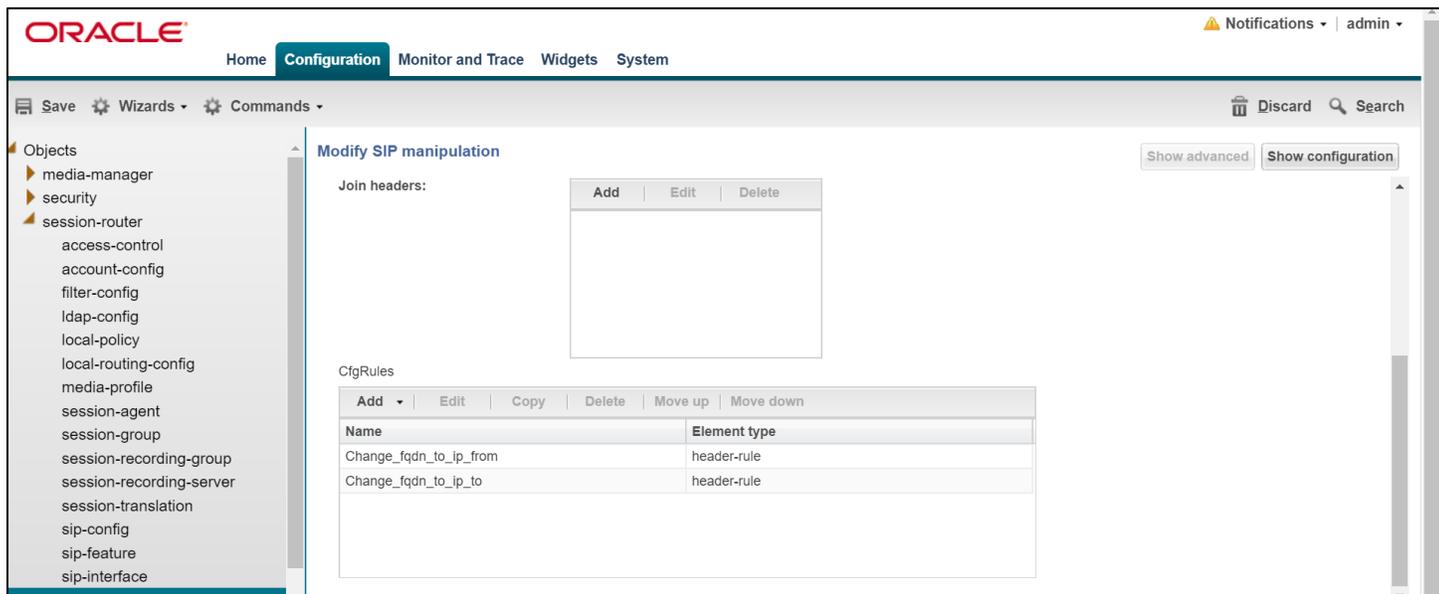

## 5.23 Siptrunk\_outmanip

We configure the manipulation Siptrunk\_outmanip to modify the SIP messages going to the SIP Trunk as below

- Change\_fqdn\_to\_ip\_from to replace the uri-host of the From header with the SBC's local ip.
- Change\_fqdn\_to\_ip\_to to replace the uri-host of the To header with the ip-address of the Trunk device.

The screenshot shows the Oracle Configuration Assistant interface. The left sidebar lists various configuration objects, with 'sip-manipulation' selected. The main area displays the 'Add SIP manipulation' dialog. The 'Name' field contains 'Siptrunk\_outmanip'. The 'Description' field is empty. Below the description are two sections: 'Split headers' and 'Join headers', each with 'Add', 'Edit', and 'Delete' buttons.

The screenshot shows the Oracle Configuration Assistant interface. The left sidebar lists various configuration objects, with 'sip-manipulation' selected. The main area displays the 'Modify SIP manipulation' dialog. The 'Join headers' section has 'Add', 'Edit', and 'Delete' buttons. Below this is a table titled 'CfgRules' with the following data:

Name	Element type
Change_fqdn_to_ip_from	header-rule
Change_fqdn_to_ip_to	header-rule

### 5.23.1 Change\_fqdn\_to\_ip\_from

It is applied as a header rule in Siptrunk\_outmanip, to replace the uri-host of the From header with the SBC's local ip.

The screenshot shows the Oracle configuration interface for adding a SIP manipulation header rule. The page title is "Add SIP manipulation / header rule". The left sidebar shows a tree view of objects, with "local-routing-config" selected. The main form contains the following fields:

Name:	Change_fqdn_to_ip_from						
Header name:	From						
Action:	manipulate						
Comparison type:	case-sensitive						
Msg type:	out-of-dialog						
Methods:	<table border="1"><tr><td>Add</td><td>Edit</td><td>Delete</td></tr><tr><td colspan="3">INVITE</td></tr></table>	Add	Edit	Delete	INVITE		
Add	Edit	Delete					
INVITE							
Match value:							
New value:							

The screenshot shows the Oracle configuration interface for adding a SIP manipulation header rule element rule. The page title is "Add SIP manipulation / header rule / element rule". The left sidebar shows a tree view of objects, with "sip-manipulation" selected. The main form contains the following fields:

Name:	from_uri
Parameter name:	
Type:	uri-host
Action:	replace
Match val type:	any
Comparison type:	case-sensitive
Match value:	
New value:	\$(LOCAL_IP)

## 5.23.2 Change\_fqdn\_to\_ip\_to

It is applied as a header rule in Siptrunk\_outmanip, to replace the uri-host of the To header with the ip –address of the Trunk device

The screenshot shows the Oracle Configuration Assistant interface. The top navigation bar includes 'ORACLE', 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The user is logged in as 'admin'. The main content area is titled 'Add SIP manipulation / header rule'. On the left, a tree view shows the configuration hierarchy: 'media-manager', 'security', and 'session-router'. The main form fields are: 'Name: Change\_fqdn\_to\_ip\_to', 'Header name: To', 'Action: manipulate', 'Comparison type: case-sensitive', 'Msg type: out-of-dialog', and 'Methods: INVITE'. There are also fields for 'Match value:' and 'New value:'. A 'Show advanced' button is visible in the top right of the form area.

The screenshot shows the Oracle Configuration Assistant interface for the 'Add SIP manipulation / header rule / element rule' configuration. The top navigation bar is the same as the previous screenshot. The main content area is titled 'Add SIP manipulation / header rule / element rule'. On the left, the tree view shows the configuration hierarchy: 'media-manager', 'security', and 'session-router'. The main form fields are: 'Name: Tohost', 'Parameter name:', 'Type: uri-host', 'Action: replace', 'Match val type: any', 'Comparison type: case-sensitive', 'Match value:', and 'New value: \$REMOTE\_IP'. A 'Show advanced' button is visible in the top right of the form area.

## 5.24 Applying the trunk side SIP manipulations to Trunk SIP Interface

The Siptrunk\_outmanip sip-manipulation is applied as the out-manipulationid in the sip-interface facing SIP Trunk

The screenshot shows the Oracle SBC Configuration interface for the 'Modify SIP interface' page. The left sidebar lists various configuration objects, including 'local-response-map', 'local-routing-config', 'media-profile', 'net-management-control', 'qos-constraints', 'response-map', 'service-health', 'session-agent', 'session-agent-id-rule', 'session-constraints', 'session-group', 'session-recording-group', 'session-recording-server', 'session-timer-profile', 'session-translation', 'sip-advanced-logging', 'sip-config', and 'sip-feature'. The main configuration area includes the following fields:

- Spl options: [Empty text field]
- Trust mode: [all (dropdown)]
- Max nat interval: [3600 (text field)] (Range: 0..4294967295)
- Stop recurse: [401,407 (text field)]
- Port map start: [0 (text field)] (Range: 0, 1025..65535)
- Port map end: [0 (text field)] (Range: 0, 1025..65535)
- In manipulationid: [Empty dropdown]
- Out manipulationid: [Siptrunk\_outmanip (dropdown)]
- SIP atcf feature: [Unchecked checkbox]
- Rfc2833 payload: [101 (text field)] (Range: 96..127)
- Rfc2833 mode: [transparent (dropdown)]
- Response map: [Empty dropdown]

## 6 Ringback Configuration

### 6.1 Ringback on Transfers

During a call transfer, the calling party does not hear a ring back tone during the process of transfer. We utilize the local playback feature of the SBC to play ring back tone during transfers. The ringback tone is triggered on receiving SIP REFER. You must upload a media playback file to /code/media on the SBC. This file must be in raw media binary format. This ringback trigger and ringback file to be played are configured on the realm facing the trunk.

The screenshot shows the Oracle SBC Configuration interface for the 'Modify Realm config' page. The left sidebar lists various configuration objects, including 'media-manager', 'codec-policy', 'dns-alg-constraints', 'dns-config', 'ice-profile', 'media-manager', 'media-policy', 'msrp-config', 'playback-config', 'realm-config', 'realm-group', 'rtcp-policy', 'static-flow', 'steering-pool', 'tcp-media-profile', 'security', 'admin-security', 'auth-params', and 'authentication'. The main configuration area includes the following fields:

- Sm icsi match for message: [Empty text area]
- Ringback trigger: [refer (dropdown)]
- Ringback file: [ringback10sec.pcm (text field)]

In addition to the ringback trigger configuration above, SDP manipulations are needed in order to play the ringback tone towards the PSTN caller. The INVITE MS Teams sends to the SBC to initiate the transfer contains the SDP attribute, a=inactive which is forwarded to the trunk and as a result of which the SBC cannot play the ring back tone to the original PSTN caller (while call is being transferred). A sendonly attribute is required by the calling party to be able to hear ringback.

The SBC is able to signal appropriately towards the SIP trunk by changing the a=inactive SDP attribute in the INVITE to a=sendonly towards PSTN. We configure sdp-mime rule under the sip-manipulation Teamsinmanip to change a=inactive to sendonly in the INVITE received from Teams. (Here the MsgType is Request). Similarly we configure the msgtype as Reply and convert the a=inactive to a=recvonly, so that inactive is not sent towards PSTN.

The 200 OK response received from the trunk contains a=recvonly in the SDP. Since Teams is expecting an a=inactive in the 200 OK for the INVITE, we configure the following sdp-mime under the sip-manipulation – Teamsoutmanip, to convert the a=recvonly to a=inactive in the 200 OK being sent to Teams for the msgtype “Request”. Here also we change the a=recvonly to a=inactive for the msgtype “reply” so that recvonly is not sent towards teams.

Manipulation	Msg Type	Match-Value	New-Value
Teamsinmanip	request	inactive	sendonly
Teamsinmanip	reply	inactive	recvonly
Teamsoutmanip	request	sendonly	inactive
Teamsoutmanip	reply	recvonly	inactive

The screenshot shows the Oracle Configuration Manager interface. The 'Configuration' tab is active. On the left, a tree view shows the configuration hierarchy under 'session-router'. The main area displays the configuration for a rule named 'Reqsendonlytoinactive'. The 'Msg type' is set to 'request'. The 'Methods' list contains 'INVITE'. The 'Action' is set to 'manipulate' and the 'Comparison type' is 'case-sensitive'. The 'Match value' and 'New value' fields are currently empty.

## 6.2 Consultative transfer configuration

The following sip-feature needs to be configured to enable support for the replaces to enable successful consultative transfer.

The screenshot displays the Oracle Configuration console interface. The top navigation bar includes the Oracle logo, a 'Notifications' dropdown, and a user profile 'admin'. The main navigation menu contains 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The 'Configuration' section is active, showing a sidebar with a list of configuration categories: 'response-map', 'service-health', 'session-agent', 'session-agent-id-rule', 'session-constraints', 'session-group', 'session-recording-group', 'session-recording-server', 'session-timer-profile', 'session-translation', 'sip-advanced-logging', 'sip-config', 'sip-feature' (highlighted), 'sip-feature-caps', 'sip-interface', 'sip-manipulation', 'sip-monitoring', 'sip-recursion-policy', 'surrogate-agent', 'survivability', and 'translation-rules'. The main content area is titled 'Modify SIP feature' and contains the following configuration fields:

Name:	<input type="text" value="replaces"/>
Realm:	<input type="text" value="access-teams"/>
Support mode inbound:	<input type="text" value="Pass"/>
Require mode inbound:	<input type="text" value="Pass"/>
Proxy require mode inbound:	<input type="text" value="Pass"/>
Support mode outbound:	<input type="text" value="Pass"/>
Require mode outbound:	<input type="text" value="Pass"/>
Proxy require mode outbound:	<input type="text" value="Pass"/>

At the bottom of the configuration area, there are 'OK' and 'Back' buttons. A 'Show advanced' button is located in the top right corner of the configuration area. The top right of the console also features a 'Discard' button and a search icon.

Configure the following sip-profile and apply to the Teams sip interface.

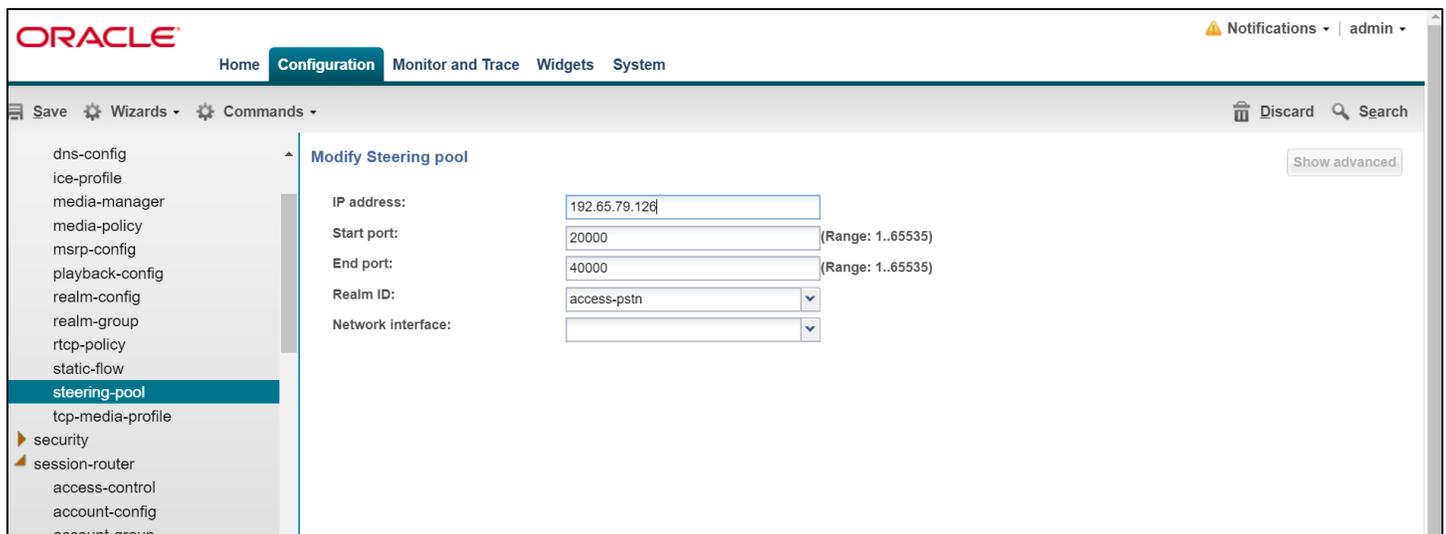

Note: The sip-profile element is available only through the CLI now. The GUI will be enhanced to support this in later releases.

To access the sip-profile element go to configure terminal->session-router->sip-profile

sip-profile	
<b>name</b>	<b>foreplace</b>

  - Mode:** srtp
  - Protocol:** sdes
- Outbound:**
  - Profile:** SDES
  - Mode:** srtp
  - Protocol:** sdes

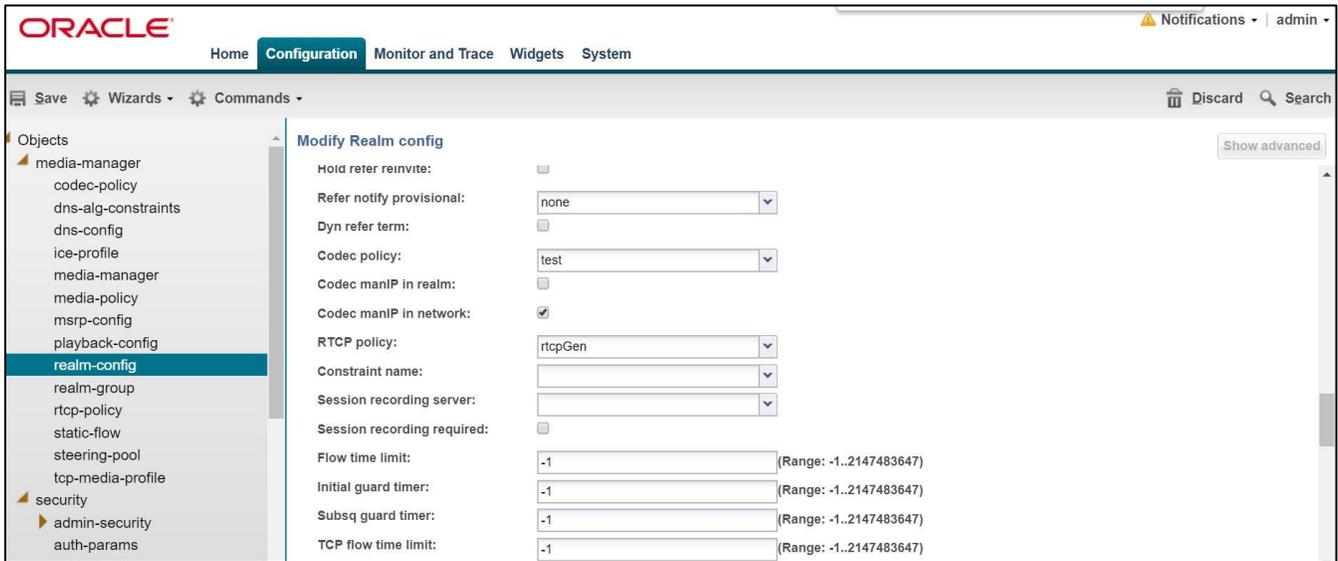

The RTP media-sec-policy is applied on the Access-pstn realm and SRTP media-sec-policy is applied on the Access-teams realm, as shown below.

## 6.6 Configure RTCP Policy

The following RTCP policy needs to be configured to generate RTCP reports towards Teams. It is applied on the realm facing Teams. It can be enabled on the realm - Access-teams. Go to Media-manager->rtcp-policy to configure rtcp-policy.

## 7 Existing SBC configuration

If the SBC being used with Microsoft Teams is an existing SBC with functional configuration with a SIP trunk, following configuration elements are required:

- [New realm-config](#)
- [Configuring a certificate for SBC Interface](#)
- [TLS-Profile](#)
- [Enable DNS](#)
- [New sip-interface](#)
- [New session-agent](#)
- [New-Session-Agent-Group](#)
- [New steering-pools](#)
- [New Local-policy](#)
- [Media-profile](#)
- [Codec-policy](#)
- [SDES Profile](#)
- [Media-sec-Policy](#)
- [Sip-manipulations](#)
- [Ice-profile](#)
- [RTCP policy](#)
- [Ringback configuration](#)

Please follow the steps mentioned in the above chapters to configure these elements.

## 8 Configuration for Emergency Calling

As part of Oracle's continued partnership with Microsoft, the Oracle Communications Session Border Controller is fully certified with Microsoft Teams Direct Routing for E911 compatibility as well as an Elin Capable Gateway.

<https://docs.microsoft.com/en-us/microsoftteams/direct-routing-border-controllers>

For more information on how to configure emergency services in your Microsoft Teams Tenant, please refer to the documentation at the link below.

<https://docs.microsoft.com/en-us/microsoftteams/what-are-emergency-locations-addresses-and-call-routing>

<https://docs.microsoft.com/en-us/microsoftteams/configure-dynamic-emergency-calling>

<https://docs.microsoft.com/en-us/microsoftteams/direct-routing-configure#configure-voice-routing>

The following will outline how to configure your Oracle SBC to handle E911 from Microsoft Teams, as well as setting up Oracle SBC Elin Gateway configuration.

### 8.1 E911

*Note: This is a configuration example, and would be an additional configuration added to what is outlined throughout this document.*

#### 8.1.1 Session Translations Config

At the time of testing, MSFT Teams sends 911 with a leading plus (+). We recommend removing that leading + on ingress so ensure the call is not considered international and rejected. We do this via a session translation rule, which in turn gets assigned to the Teams facing Realm on the SBC. If you already have a session translation assigned to this Realm, you can add the translation rule to the list in that session translation:

### 8.1.2 Translation Rule

GUI Path: session-router/translation-rule

ACL Path: config t→session-router→translation-rule

The screenshot shows the Oracle configuration interface. At the top, there is a navigation bar with 'ORACLE' in red, and tabs for 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. Below the navigation bar, there is a toolbar with 'Save', 'Wizards', and 'Commands'. On the left, a tree view shows the configuration hierarchy, with 'h323' selected. The main area is titled 'Modify Translation rules' and contains the following fields:

Id:	<input type="text" value="removeplus"/>
Type:	<input type="text" value="delete"/>
Add string:	<input type="text"/>
Add index:	<input type="text" value="0"/>
Delete string:	<input type="text" value="+"/>
Delete index:	<input type="text" value="0"/>

- Hit Ok at the bottom

Next, the translation rule needs to be assigned to a session translation before it can be added to the Teams facing Realm:

### 8.1.3 Session Translation

GUI Path: session-router/session-translation

ACL Path: config t→session-router→session-translation

Save Wizards Commands

- enforcement-profile
- enum-config
- filter-config
- h323
- home-subscriber-server
- http-alg
- iwf-config
- ldap-config
- local-policy
- local-response-map

- session-constraints
- session-group

### Modify Session translation

Id: p11removeplus

Rules calling:

Add	Edit	Delete
removeplus		

Rules called:

Add	Edit	Delete
removeplus		

As you can see above, the translation rule we configured is added as both rules calling and rules called in the session translation. Now we assign the session translation to the Realm as the in-translation-id:

### 8.1.4 Translation Added to Realm

GUI Path: media-manager/realm-config

The screenshot displays the Oracle Configuration GUI. At the top, the Oracle logo is on the left, and navigation tabs for 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System' are on the right. Below the navigation is a toolbar with 'Save', 'Wizards', and 'Commands' options. The left sidebar, titled 'Objects', contains a tree view with 'media-manager' expanded to show sub-items like 'codec-policy', 'dns-alg-constraints', 'dns-config', 'ice-profile', 'media-manager', 'media-policy', 'msrp-config', 'playback-config', 'realm-config' (highlighted), 'realm-group', 'rtcp-policy', 'static-flow', 'steering-pool', and 'tcp-media-profile'. Other sub-items include 'security', 'session-router', and 'system'. The main content area is titled 'Modify Realm config' and contains the following fields:

- Identifier:
- Description:
- Addr prefix:
- Network interfaces: 

Add	Edit	Delete
s0p0:0		
- Mm in realm:
- Mm in network:
- Mm same ip:
- QoS enable:
- Max bandwidth:
- Max priority bandwidth:
- Parent realm:
- DNS realm:
- Media policy:
- Media sec policy:
- RTCP mux:
- Ice profile:
- DTLS srtp profile:
- Srtp msm passthrough:
- Class profile:
- In translationid:

## 8.1.5 Emergency Session Handling

The Oracle® Enterprise Session Border Controller provides a mechanism to handle emergency sessions from non-allowed endpoints/agents. An endpoint is designated as non-allowed if it fails the admission control criteria specified by the allow-anonymous parameter in the Sip Inerface/SIP Ports configuration element. To enable this feature, you will need to configure the following:

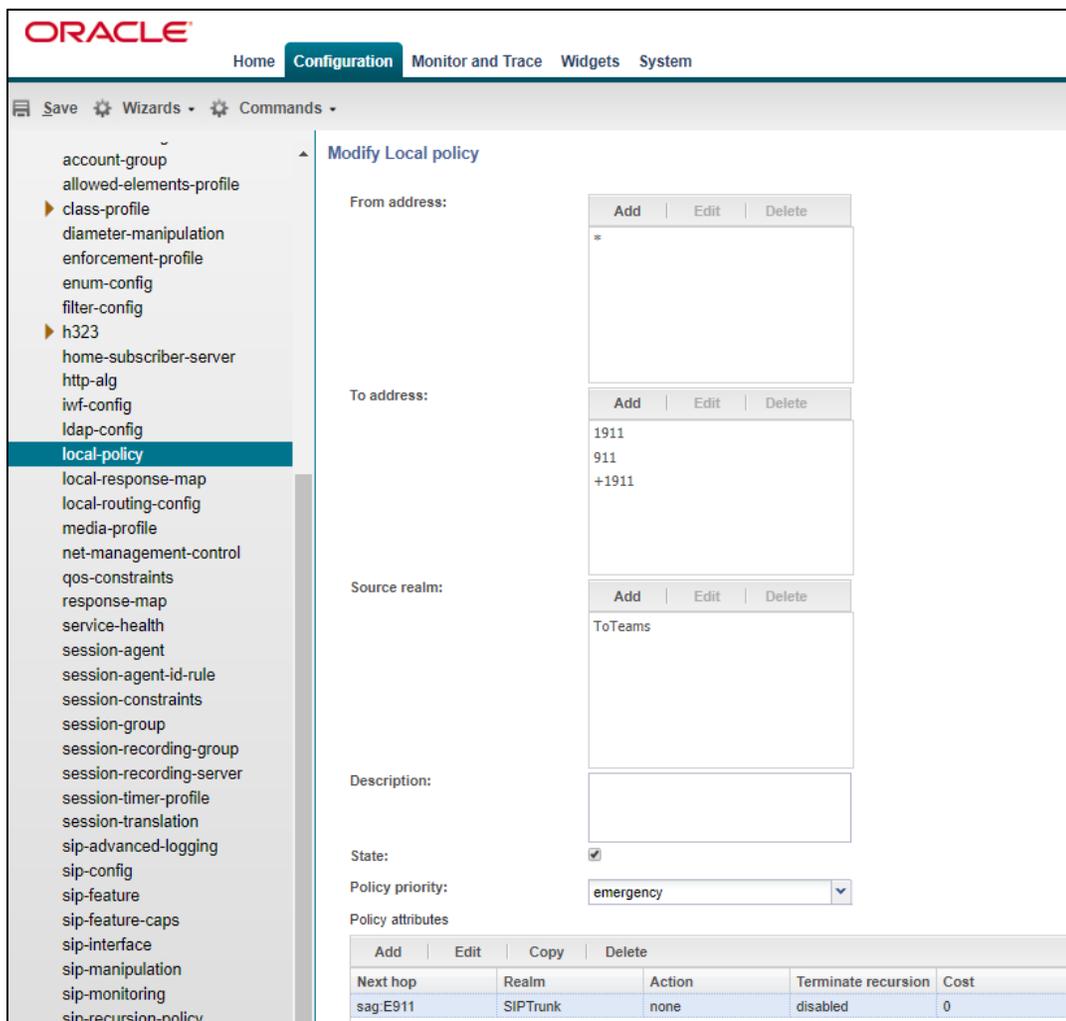

- Local Policy to Match and Route emergency calls to correct destination with policy priority set to emergency
- Enable anonymous-priority on Ingress Sip Interface

*Note: This is just a configuration example. This note assumes any session agents or session group for PSAP has already been configured:*

## 8.1.6 Local Policy Route for Emergency Calls

GUI Path: session-router/local-policy

ACL Path: config t→session-router—local-policy

The screenshot displays the Oracle Enterprise Session Border Controller GUI. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The 'Configuration' tab is active, and the left-hand navigation menu shows 'local-policy' selected. The main content area is titled 'Modify Local policy' and contains the following configuration fields:

- From address:** A text input field containing an asterisk (\*).
- To address:** A list box containing the values '1911', '911', and '+1911'.
- Source realm:** A list box containing the value 'ToTeams'.
- Description:** An empty text input field.
- State:** A checked checkbox.
- Policy priority:** A dropdown menu set to 'emergency'.
- Policy attributes:** A table with columns for 'Next hop', 'Realm', 'Action', 'Terminate recursion', and 'Cost'.

Add	Edit	Copy	Delete	
Next hop	Realm	Action	Terminate recursion	Cost
sag.E911	SIPTrunk	none	disabled	0

You would also configure a policy attribute to route emergency calls to their proper destination. In this example, we have created a SAG called e911 as the destination for all emergency calls. For instructions on how to configure [Session Agents](#) or [Session Groups](#), please click the links for examples.

Next, we'll enable anonymous-priority field in Sip-Interface:

### 8.1.7 Sip Interface Priority

GUI Path: Currently, this field is not available through GUI, and must be configured through ACLI

ACLI Path: config t→session-router→sip-interface

state	enabled
realm-id	ToTeams
description	
sip-port	
address	192.168.1.10
port	5061
transport-protocol	TLS
tls-profile	TLSTeams

port-map-start	0
port-map-end	0
in-manipulationid	RespondOPTIONS
out-manipulationid	
sip-ims-feature	disabled
sip-atcf-feature	disabled
subscribe-reg-event	disabled
operator-identifier	
<b>anonymous-priority</b>	<b>emergency</b>

For more information on how this feature works, please see the [SCZ830 Configuration Guide, Page 4-185](#).

## 8.1.8 Net-Management Control

The Oracle Communications Session Border Controller supports network management controls for multimedia traffic specifically for static call gapping and 911 exemption handling. These controls limit the volume or rate of traffic for a specific set of dialed numbers or dialed number prefixes (destination codes).

To enable network management controls on your Oracle Communications Session Border Controller, you set up the net-management-control configuration and then enable the application of those rules on a per-realm basis. Each network management control rule has a unique name, in addition to information about the destination (IP address, FQDN, or destination number or prefix), how to perform network management (control type), whether to reject or divert the call, the next hop for routing, and information about status/cause codes. For more information about Network Management Controls, please refer to the [Configuration Guide, Chapter 11](#).

GUI Path: session-router/net-management-control

ACL Path: config t→session-router→net-management-control

Use the below example to configure net-management-control and assign it to the Teams realm. Please note, net-management-control Realm parameter is not available through the GUI, so it must be assigned via CLI to the appropriate realm.

The screenshot displays the Oracle Communications Session Border Controller GUI. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. The 'Configuration' tab is active. On the left, a tree view shows the configuration hierarchy: 'Objects' > 'session-router' > 'net-management-control'. The main area is titled 'Modify Net management control' and contains the following configuration fields:

Name:	EmergencyRoute						
State:	<input checked="" type="checkbox"/>						
Type:	priority						
Value:	0						
Treatment:	divert						
Next hop:	SAG:E911						
Realm next hop:	SIPTrunk						
Protocol next hop:	SIP						
Status code:	503						
Cause code:	63						
Gap rate max count:	0						
Gap rate window size:	0						
Destination identifier:	<table border="1"><tr><td>Add</td><td>Edit</td><td>Delete</td></tr><tr><td colspan="3">911</td></tr></table>	Add	Edit	Delete	911		
Add	Edit	Delete					
911							

*Note: Net-Management-Controls do not adhere to any constraints configured on your SBC due to the emergency nature of the call flows handled by this element.*

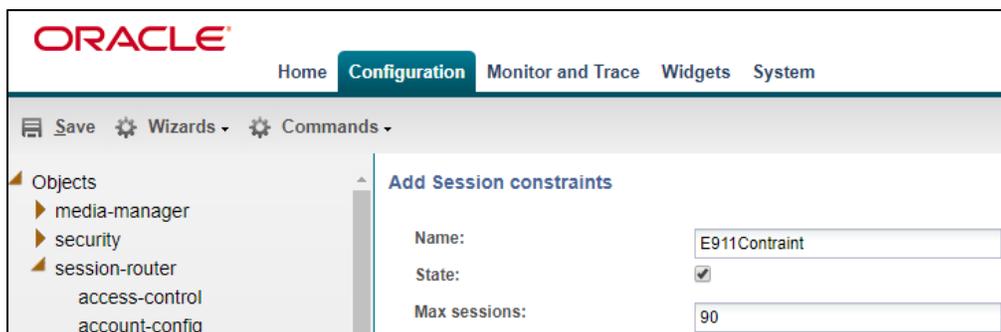

### 8.1.9 Session Constraints for E911

In order for the SBC to have the ability to handle emergency calls in high volume environment, we recommend configuring and applying session constraints for each realm on your SBC to allow a small portion of your licensed sessions to be allocated to emergency calls.

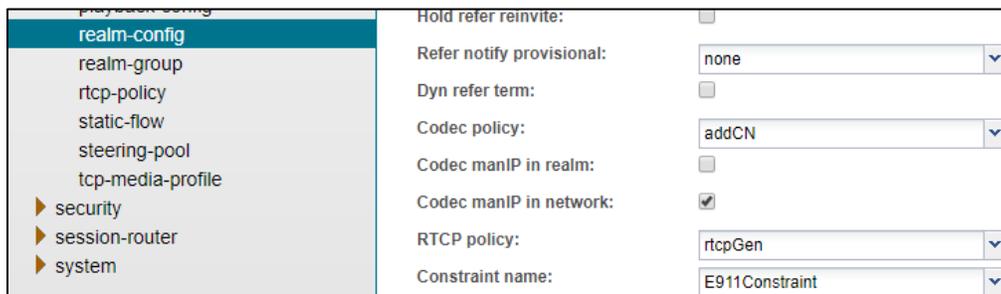

The below example is a very basic constraint setup limiting the number of calls allowed to traverse a realm. For the purposes of this example, we assume there are 100 licensed sessions on the SBC, so we'll limit the number of calls on the realms to 90, leaving 10 licensed session for emergency calls. Again, as noted above, when net management controls are configured to handle emergency traffic, constraints do not apply to those calls.

GUI Path: session-router/session-constraints

ACLI Path: config t→session-router→session-constraints

And now we apply this constraint to realms:

## 8.2 Elin Gateway

The Oracle® Enterprise Session Border Controller supports E911 ELIN for Teams-enabled Enterprises using the ELIN\_Gateway SPL option. Enable this option in the global SPL configuration. The Oracle® Enterprise Session Border Controller supports up to 300 ELIN numbers simultaneously and it can reuse numbers allowing a greater number of emergency calls

For more information about the SBC's Emergency Location Identification Number (ELIN) Gateway Support, please refer to the [830 Configuration Guide](#), Page 19-25

GUI Path: system/spl-config

ACLI Path: config t→system→spl-config

The only entry required to Enable support for Elin Gateway is:

Elin-Gateway=<value>

Valid Values are either 30 or 60. This determines how long (minutes) the SBC will retain the mapping in memory. Default value is 30. For the purposes of testing, we increased that value to 60 minutes, as shown in the example below.

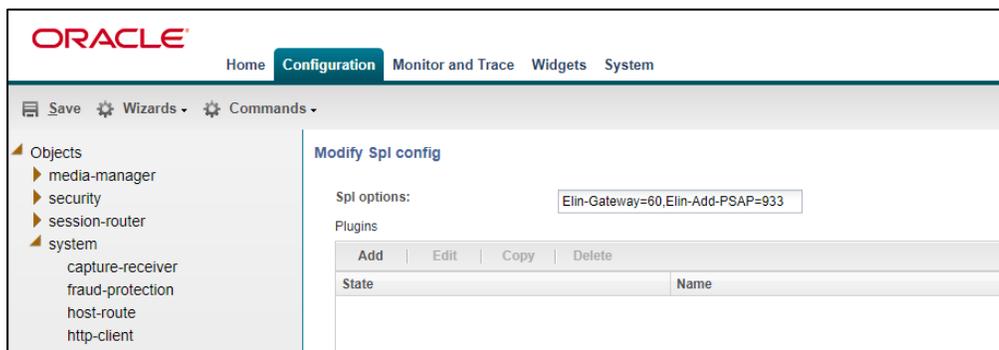

An optional configuration parameter:

Elin-Add-PSAP=<value>

Where <value> is one or more PSAP numbers, For multiple numbers, place the numbers within quotes, separate the numbers with a comma, and use no spaces. A single number does not require enclosure in quotes.

Examples: Elin-Add-PSAP=999 and Elin-AddPSAP="999,000,114"

By Default, Oracle delivers the SBC preconfigured with the 911 and 112 Public Safety Answering Point (PSAP) callback numbers

## 8.2.1 Sip-Manipulation for Teams ELIN

By Default, the Oracle SBC with Elin SPL enabled, looks at the <NAM> field in the metadata of an Invite to extract the ELIN numbers and the FROM User uri for mapping. Since Microsoft Teams sends the ELIN information in an <Elin> field, and to avoid any issues due to ani masking on the Teams side, we have created the following sip-manipulation rule to move the information in the <Elin> field to the <Nam> field, and we replace the User part of the FROM header with the user part of the PAI. The manipulation gets assigned to either the Teams Realm or Sip Interface, and assures proper Elin mapping in the SBC.

*Note: If there is an existing Sip Manipulation rule already assigned as the in-manipulation-id on either the realm or sip interface, these rules would need to be added to that [existing manipulation](#).*

GUI Path: session-router/sip-manipulation

ALCI Path: config t→session-router→sip-manipulation

While this can be configured via the GUI, we are using the ACLI output to provide and example config for ease of viewing:

## 9 Appendix A

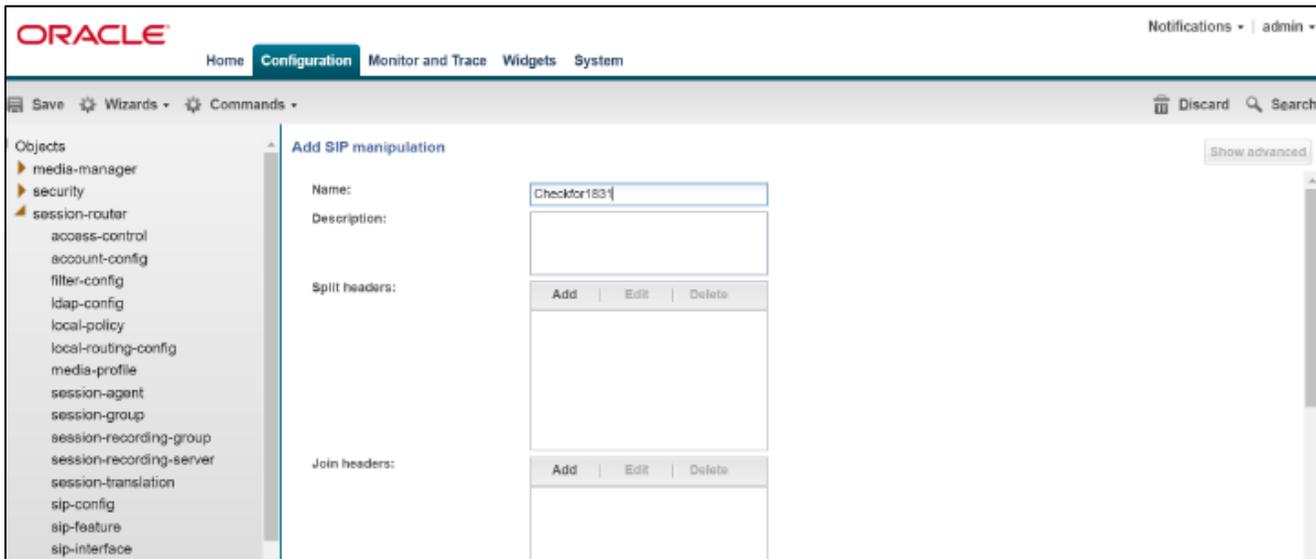

### 9.1 Ringback on inbound calls to Teams and early media

In certain deployments, a PSTN caller may experience silence on an inbound call into Teams in place of a ringback tone. When Teams receives an INVITE, after signaling 183 with SDP, Teams does not play ringback and expects the SBC to signal appropriately to the SIP Trunk provider and play local ringback. To signal the trunk to play the ringback, the SBC presents 180 Ringing to the trunk instead of the 183 Session Progress received from Teams.

In order to accommodate the 183 with SDP messages that signal early media in cases of simultaneous ringing set to IVR, we inspect the SDP of the 183s received before converting them to 180 Ringing messages. If the SDP of the 183 does not contain the IP address of SBC (which is the case when Teams clients have simultaneous ringing set to IVRs), we strip the SDP from the 183 and convert it to a 180 Ringing message and forward it to the trunk. This is achieved through the following sip-manipulation.

Apply this in the SIP Manipulation Teamsinmanip.

*Note: If running the GA release, SCZ830m1p8A, please see [Appendix D](#) prior to configuring sip manipulations in your Oracle SBC. This appendix outlines how new features added to the GA release will help simplify your configuration by eliminating the need for most, if not all required sip manipulations.*

## 10 Appendix B

### 10.1 DDoS Prevention for Peering Environments

The Oracle Session Border Controller (SBC) family of products are designed to increase security when deploying Voice over IP (VoIP) or Unified Communications (UC) solutions. Properly configured, Oracle's SBC family helps protect IT assets, safeguard confidential information, and mitigate risks—all while ensuring the high service levels which users expect from the corporate phone system and the public telephone network.

Please note, DDOS values are specific to platform and environment. For more detailed information please refer to the Oracle Communications SBC Security Guide.

[https://docs.oracle.com/cd/F12246\\_01/doc/sbc\\_scz830\\_security.pdf](https://docs.oracle.com/cd/F12246_01/doc/sbc_scz830_security.pdf)

However. While specific values are environment specific, there are some basic security parameters that can be implemented on the SBC that will help secure your setup.

1. On all public facing interfaces, create Access-Controls to only allow sip traffic from trusted IP's with a trust level of high
2. Set the access control trust level on public facing realms to HIGH
3. Modify the minimum and maximum untrusted signaling bandwidth parameters in the global media manger to minimize the throughput untrusted traffic has to work with.

The below examples of Access Control and Realm Trust level would be configured on and associated with the Realm facing Microsoft Teams. This model can be followed for any of the public facing interfaces, ie..Sip Trunk, etc....

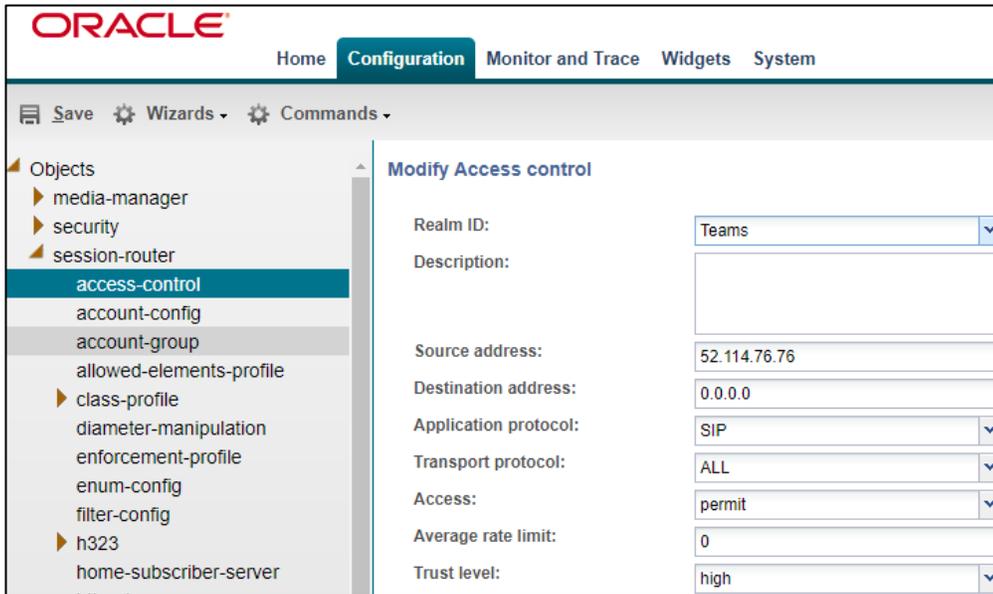

#### 10.1.1 Access Control

GUI Path: session-router/access-control

ACLI Path: config t→session-router→access-control

*The below example is for one of the possible six IP addresses MSFT will be sending and receiving SIP traffic to and from.*

Use this example to create ACL's for all MSFT Teams IP addresses.

*As an alternative, the destination address can also be set to the SIP interface IP address associated with the realm.*

### 10.1.2 Realm Config

GUI Path: media-manager/realm-config

ACLI Path: config t→media-manager→realm-config

In the example below, notice the access control trust level matches the trust level of the ACL configured above. When these two fields match, it creates an implicit deny on this realm, so only SIP traffic from IP addresses configured as ACL's with matching trust level to the realm will be allowed to send traffic to your SBC. For more information on how trust level setting in ACL's and realms effect traffic, please refer to the [SCZ830 Security Guide, Page 3-10](#)

The screenshot displays the Oracle Configuration Manager interface. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. Below this, there are icons for 'Save', 'Wizards', and 'Commands'. The left sidebar shows a tree view of objects, with 'realm-config' selected. The main area is titled 'Modify Realm config' and contains the following fields:

- Identifier: Teams
- Description: Realm Facing Teams Direct Routing
- Addr prefix: 0.0.0.0
- Network interfaces: M00:0.4 (with Add, Edit, Delete buttons)
- Mm in realm:
- Mm in network:

## 11 Appendix C

### 11.1 SBC Behind NAT SPL configuration

This configuration is needed when your SBC is behind a NAT device. This is configured to avoid loss in voice path and SIP signaling.

The Support for SBC Behind NAT SPL plug-in changes information in SIP messages to hide the end point located inside the private network. The specific information that the Support for SBC Behind NAT SPL plug-in changes depends on the direction of the call, for example, from the NAT device to the SBC or from the SBC to the NAT device. Configure the Support for SBC Behind NAT SPL plug-in for each SIP interface that is connected to a NAT device. One public-private address pair is required for each SIP interface that uses the SPL plug-in, as follows.

- The private IP address must be the same as the SIP Interface and Steering Pool IP address.
- The public IP address must be the public IP address of the NAT device

Here is an example configuration with SBC Behind NAT SPL config. The SPL is applied to the Teams side SIP interface.

To configure SBC Behind NAT SPL Plug in, Go to session-router->sip-interface->spl-options and input the following value, save and activate.

HeaderNatPublicSipIfIp=52.151.236.203,HeaderNatPrivateSipIfIp=10.0.4.4

Here HeaderNatPublicSipIfIp is the public interface ip and HeaderNatPrivateSipIfIp is the private ip.

The screenshot displays the Oracle Configuration Manager web interface. The main content area is titled "Modify SIP interface". Under the "SPL options:" label, a text input field contains the value "HeaderNatPublicSipIfIp=52.151.236.203". Below this, several other configuration parameters are listed with their respective values and ranges where applicable:

- Trust mode: all (dropdown menu)
- Max nat interval: 3600 (Range: 0..4294967295)
- Stop recurse: 401,407
- Port map start: 0 (Range: 0, 1025..65535)
- Port map end: 0 (Range: 0, 1025..65535)
- In manipulationid: RespondOPTIONS (dropdown menu)
- Out manipulationid: PSTNHub (dropdown menu)
- SIP atcf feature:
- Rfc2833 payload: 404 (Range: 06..127)

At the bottom of the configuration area, there are "OK" and "Back" buttons. The left sidebar shows a tree view of configuration categories, with "sip-interface" selected. The top navigation bar includes "Home", "Configuration", "Monitor and Trace", "Widgets", and "System".

Similarly configure the PSTN side as well.

## 12 Appendix D

### 12.1 Sip Manipulation Replacement

To simplify the ORACLE SBC configuration, the ORACLE SBC GA Release, SCZ830m1p8A, (available for download through My Oracle Support Portal, <https://support.oracle.com/portal/>, or via Oracle Software Delivery Cloud (<https://edelivery.oracle.com/>), contains three additional SBC configuration parameters not found in prior releases.

The purpose of these four parameters is to replace a majority of the Sip Manipulation rules required to be configured in the ORACLE SBC in order to properly interface with Microsoft Teams Direct Routing.

#### 12.1.1 Teams Facing Realm

The first three parameters are found under the realm-config, and would be enabled in Realms facing Microsoft Teams. They are:

- **Teams-FQDN**
- **Teams FQDN in URI**
- **SDP inactive only**

#### 12.1.2 Teams FQDN

This is where you will add the SBC's FQDN required to interface with Microsoft Teams Direct routing interface.

#### 12.1.3 Teams FQDN in URI

When enabled, this parameter takes the FQDN configured under hostname of the [Teams FQDN](#), and inserts that into the [Contact and FROM headers of Invites](#) generated by the SBC towards Teams, as well as the Contact header in all final responses which satisfies the Microsoft Teams requirement outlined in the [Important Information](#) Section of this document. This also adds a new "X-MS-SBC" Header to both Invite and OPTIONS Requests, which takes the place of the [User-Agent](#) header currently being added via Sip Manipulation. Lastly, SBC will add a [Contact Header](#) to outgoing SIP Options Pings, also containing the FQDN of the SBC listed under the hostname field of the network interface, and with the Contact Header added to OPTION Requests generated by the SBC, [Record Route](#) is no longer required.

#### 12.1.4 SDP inactive only

When enabled on Teams facing realm(s), this will modify the following [SDP attributes](#) in both requests and responses to and from Microsoft Teams:

Message Type	Match Value	New Value
request	inactive	sendonly
reply	inactive	recvonly
request	sendonly	inactive
reply	recvonly	inactive

The screenshot shows the Oracle SBC Configuration interface. The main menu includes Home, Configuration, Monitor and Trace, Widgets, and System. The left sidebar shows a tree of objects, with 'realm-config' selected. The main content area is titled 'Modify Realm config' and contains the following fields:

- Identifier: Teams
- Description: carrier tenant telechat.o-test06161977.com
- Addr prefix: 0.0.0.0
- Network interfaces: M00:0.4
- Mm in realm:
- Mm in network:
- Mm same ip:
- QoS enable:
- Max bandwidth: 0
- Max priority bandwidth: 0
- Parent realm: (dropdown)
- DNS realm: (dropdown)
- Media policy: (dropdown)
- Media sec policy: sdesPolicy
- RTCP mux:
- Ice profile: (dropdown)
- Teams fqdn: oracleesbc2.woodgrovebank.us
- Teams fqdn in uri:
- SDP inactive only:

*Please note, if the Teams FQDN field under realm-config is not populated with the Oracle SBC's FQDN, it will default back to the hostname parameter of the [Network Interface](#).*

### 12.1.5 Teams Session Agents

The third parameter is found under the session agent configuration element and will be enabled on all three [session agents](#) configured for microsoft teams. Its called

#### ping response

### 12.1.6 Ping Response

When enabled, the SBC responds with a 200OK to all Sip Options Pings it receives from trusted agents. This takes the place of the current Sip Manipulation, [RepondOptions](#).

The screenshot shows the Oracle SBC Configuration interface. The top navigation bar includes 'Home', 'Configuration', 'Monitor and Trace', 'Widgets', and 'System'. Below this is a secondary navigation bar with 'Save', 'Wizards', and 'Commands'. The left-hand navigation pane shows a tree structure of objects, with 'session-agent' selected. The main configuration area is titled 'Modify Session agent' and contains the following fields and controls:

- Ping send mode:** A dropdown menu set to 'keep-alive'.
- Ping all addresses:** A checkbox that is currently unchecked.
- Ping in service response codes:** A text input field.
- Options:** A table with columns for 'Add', 'Edit', and 'Delete'.
- Spl options:** A text input field.
- Media profiles:** A table with columns for 'Add', 'Edit', and 'Delete'.
- In translationid:** A dropdown menu.
- Out translationid:** A dropdown menu.
- Trust me:** A checkbox that is currently unchecked.
- Local response map:** A dropdown menu.
- Ping response:** A checkbox that is checked, with a red arrow pointing to it.

### 13 Important Note:

Due to planned upgrades to Microsoft Teams Direct Routing, it is now a requirement for SBC's to present their FQDN in the host URI of the Contact Header in all final responses sent to Microsoft Teams. In order to accommodate this, changes to the configuration of your SBC may be needed. By default, the SBC add's the sip interface IP address to the host-uri of the Contact header in all responses. In order to change the host part of the Contact header from IP to FQDN, we'll utilize the Oracle SBC's sip-manipulation feature.

For SBC's running a release prior to SCZ830M1P8A, you should already have a [TeamsOutManipulation](#) that contains a header rule that modifies the host part of the Contact header in Requests toward Microsoft Teams. A simple change may be needed to this header rule to ensure we are meeting this new requirement. Please make sure the **Msg type** in this rule is set to **ANY** as outlined in this guide. This allows the SBC to modify the Contact Host in both requests and responses, satisfying this change. For an example, please see [Alter contact](#).

For SBC's running release SCZ830m1p8A or later, and have enabled the new features outlined in [AppendixD](#), the host-uri of the Contact of all responses towards Microsoft Teams will contain the SBC's FQDN in the host-uri of the Contact Header, so no change will be needed.
