- LOD System Architecture
- Size and Scale of e-Stat LOD
- SPARQL Performance Concerns
- Database Design to Improve Performance

Introduction of e-Stat System

- Portal Site for Official Statistics of Japan

- In 2008, e-Stat started to publish statistical data of government agencies (Format: Excel)
- In 2014, API service started (Format: XML, JSON, CSV)
- **In 2016, LOD (Linked Open Data) service started (Format: RDF)**

The screenshot shows the e-Stat portal site for Statistics of Japan. The header includes the e-Stat logo, the text 'Statistics of Japan', and a description: 'e-Stat is a portal site for Japanese Government Statistics.' Navigation links include 'Contact us', 'Help', and 'Japanese'. A main menu bar contains 'Browse Statistics', 'Visualisations & Tools', 'Resources', and 'Links'. The main content area is divided into sections: 'Browse Statistics' (with sub-sections 'Data', 'Theme', 'Organization'), 'Resources' (with sub-sections 'Developers', 'SDDS Plus'), and 'Visualisations & Tools' (with sub-sections 'Trend', 'GIS', 'Region'). A search bar is located below the 'Browse Statistics' section.

e-Stat (<https://www.e-stat.go.jp/>)

File download

2008

610 statistics
1.4 million tables

API

2014

230 statistics
150 thousand datasets

LOD

2016

9 statistics
87 datasets
2.1 billion triples

What is RDF and LOD?

RDF (Resource Description Framework)

- RDF is a standard model for data interchange on the web.
- RDF uses **URIs** to name the relationship as well as the two ends of the link (this is usually referred to as a **Triple**).

Structure of Triple

Structure of RDF Graph

LOD (Linked Open Data)

- LOD is structured open data interlinked with other data.
- LOD builds on RDF technologies.

TIM BERNERS-LEE'S FIVE-STAR SCHEME

<http://5stardata.info>

Why We Developed LOD

From “Link to File” To “Link to Data”

Clarify semantics and origins for data

Link to File

Assign URI to page
(<http://www.e-stat.go.jp/pages.html>)

Assign URI to file
(<http://www.e-stat.go.jp/xls0001.xls>)

Link to Data

Sex Age	Total (Sex)			Male		
	...	44 years [Person]	45 years [Person]	...	44 years [Person]	45 years [Person]
Standard area code	...	...	...	...	...	...
Saitama-city	...	16,130	19,245	...	8,293	9,938
Kawaguchi-city	...	6,582	8,022	...	3,526	4,289
...	...	...	...	...	...	...

Assign URI to each data
(<http://data.e-stat.go.jp/lod/.../obs00001>)

Assign URI to each data
(<http://data.e-stat.go.jp/lod/.../C11201>)

Why We Developed LOD

Metadata for statistical data in Japan is not standardized, which makes it hard to process data.

➡ Define standardized metadata as **RDF** to make it **machine-readable**

How We Configured e-Stat LOD

Example: The population of 44-year-old men in Kawaguchi City in 2010

e.g. Population of 2010 Population census

Original
Excel format

Sex Age Standard area code	Total (Sex)				Male ¹		Female	
	...	44 years [Unit Of Person]	45 years [Unit Of Person]	...	44 years ² [Unit Of Person]	45 years [Unit Of Person]	...	...
...	...	...	...	...	...	...	...	...
Saitama-city	...	16,130	19,245	...	8,293	9,938	...	...
Kawaguchi-city ³	...	6,582	8,022	...	3,526 ⁴	4,289	...	...
...	...	...	...	...	...	...	...	...

convert each observation values (cells) into RDF data

Converted
RDF format
(R2RML)

Integrating GeoSpatial RDF Data in e-Stat LOD

Major statistics such as Population Census are integrated with more fine-grained location data, such as 250m x 250m square grids, which are defined as *Polygons*.

✓ Statistical data can be obtained with GeoSPARQL.

Example of GeoSPARQL *FILTER* expression

```
FILTER (  
  ogcf:sfWithin(  
    ?wkt ,  
    "POLYGON(...)"^^geo:wktLiteral  
  )  
)
```

Query population info
WITHIN a search polygon

Sample Application

<https://data.e-stat.go.jp/lodw/en/>

Outline Guidelines Providing data RDF Schema SPARQL endpoint

Top Page / Guidelines / LOD sample applications

LOD sample applications

Sample applications searching statistical LOD is provided.

Search LOD on map

When you click on the map, the area name is searched and statistical data of the area is displayed.
Area name is searched by geographical information (latitude and longitude) using GeoSPARQL.

Target area: prefectures, municipalities, small areas, and grid squares (3rd, 4th and 5th)
Statistical data: Population census, Economic Census, Internal migration in Japan, etc. (It depends on the area)

Easy LOD search

(in Japanese)

Search LOD on map

HOME > LOD sample applications > Search LOD on map

Select area on map

Click on the map to display a list of applicable regions on the right. (Grid code is using the [World grid code](#).)

View polygon(Small area) View polygon(3rd grid) View polygon(4th grid) View polygon(5th grid)

Selected region list

All area

View data

Searching statistical LOD data from latitude and longitude information (using GeoSPARQL).

View SPARQL

Sample Application

Select area on map

Click on the map to display a list of applicable regions on the right. (Grid code is using the [World postal codes](#).)

View polygon(Small area) View polygon(3rd grid) View polygon(4th grid) View polygon(5th grid)

Region name

All area
Tokyo-to
Ku-area
Arakawa-ku
荒川 3 丁目
3rd grid : 2053394682
4th grid : 20533946822
5th grid : 205339468221

View data

LOD System Architecture

Oracle Gen2 Cloud

- Production env. for **e-Stat “LOD” system**
- **Publishes RDF data** generated on the on-premise Exadata

Fuseki SPARQL Endpoint

LOD User

Service monitoring

Management Cloud

Compute Cloud

Database Cloud
Extreme Performance
(BareMetal instance)

18^c

Transfer RDF files

On-Premise (Exadata)

- Production env. for basic **e-Stat systems**
- Publishes statistical data in relational tables
- **Generates RDF data** from relational tables

e-Stat Databases

Transform
tables to RDF
(R2RML)

Oracle Database

12^c

e-Stat User

SPARQL Performance Concerns

- ✓ In 2018, triples increased to 1,300 million (including GeoSpatial data).
 - At that time, the e-Stat LOD was running on on-premise Exadata 12cR2.

- ✓ SPARQL performance became no longer acceptable...
 - Tested 138 different SPARQL queries (including several GeoSPARQL)

	Exadata 12cR2
Avg. SPARQL response time	65.74 secs
Number of queries running over 10 sec.	108
Number of queries running over 300 sec.	13

► We needed a drastic measures to improve SPARQL performance!

Database Design to Improve Performance

The following tuning drastically improved query performance.

1. Using Database In-Memory features
2. Partitioning RDF table by triple “predicate”
3. Optimizing Optimizer Statistics based on actual SPARQLs

Tuning 1, 2 are only available from Oracle 18c.

Database Design to Improve SPARQL Performance

1. Using Database In-Memory Features

DB In-Memory (DBIM) improved SPARQL performance by 10 to 60 times.

- ✓ Enabling DBIM for RDF is very simple.

```
exec SEM_APIS.ENABLE_INMEMORY(TRUE);
```

- ✓ To reduce the amount of data accessed:
 - The populated data is *automatically* compressed in memory
 - In-Memory Indexes *automatically* prunes the data accessed

2. Partitioning RDF Table by Triple “predicate”

In many cases, graph patterns in SPARQL queries specify “predicate” URI and query “object” values.

**subject
(variable)**

```

select ?year ?population
where {
  ?s estat-measure:population ?population;
    sdmx-dimension:refArea / rdfs:label 'Kyoto-shi'@en ;
    cd-dimension:timePeriod ?year ;
    cd-dimension:sex cd-code:sex-all ;
    cd-dimension:nationality cd-code:nationality-japan ;
    g00200521-dimension-2010:area g00200521-code-2010:area-all ;
    cd-dimension:age cd-code:age-all .
}

```

**object
(variable, literal, URI)**

predicate
(URI specified)

2. Partitioning RDF Table by Triple “predicate”

To reduce the amount of data accessed,
we partitioned the RDF_LINK\$ table using hash values of the RDF predicate IDs.

3. Optimizing Optimizer Statistics

In Oracle Database, RDF triples are stored in relational tables (RDF_LINK\$, RDF_VALUE\$, ...), so SPARQLs are translated and executed as semantically the same SQLs.

► Optimizer Statistics are very important to generate optimal execution plans.

Examples of Optimizer Statistics

RDF_LINK\$
subject, predicate, object IDs

Number of rows

Avg. row length

RDF_VALUE\$
value, type, ID to value mapping

**Distinct num of
values
in each column**

e.t.c.

Optimizer makes
optimal execution plans
considering statistics

Full Table Scan or Index Scan ?

JOIN order

JOIN method (LOOP or HASH ?)

e.t.c.

Database Design to Improve SPARQL Performance

3. Optimizing Optimizer Statistics

For the optimizer to make a good execution plan against complex SPARQL queries, we gathered **column group statistics**, which enables optimizer to consider a correlationship between different columns. Which column group statistics are useful was determined using **SPARQLs actually executed so far in the e-Stat LOD**.

STEP1: Tell the database to monitor column group usage for the specified seconds.

```
exec DBMS_STATS.SEED_COL_USAGE(NULL, NULL, 600);
```

STEP2: Execute as many SPARQLs as possible, which are executed so far, within the specified time

STEP3: Mark the useful column groups detected during the monitoring

```
SELECT DBMS_STATS.CREATE_EXTENDED_STATS('MDSYS', 'RDF_LINK$') FROM DUAL;
```

STEP4: Gather statistics by a pre-built procedure SEM_PERF.GATHER_STATS.
The marked column group statistics are automatically gathered.

```
exec SEM_PERF.GATHER_STATS(...);
```

Database Design to Improve SPARQL Performance

How Much SPARQL Performance Improved?

Tested 138 different SPARQL queries against 1.3 billion triples (including several GeoSPARQL)	On-prem Exadata Oracle 12cR2 (former platform)	Oracle Gen2 Cloud Oracle 18c with tunings
Avg. SPARQL response time	65.74 sec.	1.27 sec.

Summary / Key Takeaways

- ✓ Publication of the 1st statistical LOD in Japan
 - 9 major statistics are published as LOD with Oracle Cloud
 - RDF triples are generated by use of R2RML from relational tables
 - GeoSpatial triples are integrated and published as LOD
- ✓ Performance improvement for SPARQL queries
 - We achieved 50 times faster performance applying the following changes:
 - Migrating the entire LOD platform to Oracle Gen2 Cloud
 - Utilizing DBIM features
 - Partitioning a RDF table by triple predicate
 - Gathering column group statistics

Questions & Answers

ANALYTICS AND DATA SUMMIT 2020

All Analytics. All Data.
No Nonsense.

February 25-27, 2020

How We Configured e-Stat LOD

Data in e-Stat LOD is defined using **RDF Data Cube Vocabulary (W3C)**

- The RDF Data Cube Vocabulary provides a way to publish multi-dimensional statistics in such a way that it can be linked to related data sets and concept, (<https://www.w3.org/TR/vocab-data-cube/>).
- Each observation, or data in each cell, is described by dimensions, measures, and attributes.

Dimension

Measure

e.g. **Population** of 2010 Population census

	Total (Sex)				Male				Female
	44 years	45 years			44 years	45 years			
	[Unit Of Person]	[Unit Of Person]			[Unit Of Person]	[Unit Of Person]			
...	...	...	...	...	...	...	...	...	...
Saitama-city	16,130	19,245	...	...	8,293	9,938	...	...	...
Kawaguchi-city	6,582	8,022	...	...	3,526	4,289	...	...	...
...	...	...	...	...	...	...	...	...	...

Attribute

Observation

How We Configured e-Stat LOD

RDF data was generated from statistics tables in our database with **R2RML** (R2RML = **R**DB to **R**DF Mapping Language).

Statistics Tables
(Relational tables)

*Transform
tables to RDF format
(R2RML)*

Example of R2RML mapping file

```
@prefix rr: <http://www.w3.org/ns/r2rml#>.
@prefix ex: <http://example.com/ns#>.

<#TriplesMap1>
  rr:logicalTable [ rr:tableName "EMP" ];
  rr:subjectMap [
    rr:template "http://data.example.com/employee/{EMPNO}";
    rr:class ex:Employee;
  ];
  rr:predicateObjectMap [
    rr:predicate ex:name;
    rr:objectMap [ rr:column "ENAME" ];
  ].
```

R2RML defines:

- Base table(s) / view(s)
- Rules that map each row in the base table to RDF triples

Integrating GeoSpatial RDF Data in e-Stat LOD

Size and Scale of e-Stat LOD (as of today)

AP Tier

Fuseki on Jetty (x2 VM instances)

- CPU: 8 cores
- RAM: 120 GB

DB Tier

Oracle Database Extreme Performance

- CPU: 12 cores
- RAM: 754 GB
- BareMetal Instance
- Number of Triples: 2.1 billion

Database Design to Improve SPARQL Performance

1. Using Database In-Memory Features

DB In-Memory Settings for e-Stat LOD

- ✓ 380GB In-Memory Area (SGA = 600GB)
- ✓ Set the RDF semantic network indexes to INVISIBLE for the optimizer

RDF_LINK\$

Two semantic network indexes are created on RDF_LINK\$ table by default.

- Index 1: Predicate - Object – Subject
- Index 2: Predicate - Subject - Object

- ✓ Minimize the area for METADATA to maximize the In-Memory area size for DATA
 - Set “_inmemory_64k_percent”=1 to reduce the metadata area to 1%

Database Design to Improve SPARQL Performance

1. Using Database In-Memory Features

Example: Tested SPARQL Query

Queries population census data in Kyoto City

```
select ?year ?population
where {
  ?s estat-measure:population ?population;
  sdmx-dimension:refArea / rdfs:label 'Kyoto-shi'@en ;
  cd-dimension:timePeriod ?year ;
  cd-dimension:sex cd-code:sex-all ;
  cd-dimension:nationality cd-code:nationality-japan ;
  g00200521-dimension-2010:area g00200521-code-2010:area-all ;
  cd-dimension:age cd-code:age-all .
}
```

year	population
"2015"^^xsd:gYear	"1412924"^^xsd:decimal
"2010"^^xsd:gYear	"1408039"^^xsd:decimal

WITHOUT DB In-Memory

7.1 sec

WITH DB In-Memory

0.58 sec

**12x
faster**

2. Partitioning RDF Table by Triple “predicate”

Partitioning Settings for e-Stat LOD

- ✓ Hash-Partitioning RDF_LINK\$ can be done when creating a semantic network.

```
BEGIN
  SEM_APIS.CREATE_SEM_NETWORK(
    '< tablespace name for semantic network >',
    options=> 'MODEL_PARTITIONING=BY_HASH_P MODEL_PARTITIONS=64 '
  );
END;
/
```

- ✓ The number of partitions = 64
 - Partitioning by Hash should be done by a power of 2 (2, 4, 8, 16, 32, 64, 128, ...)
to equally distribute the number of triples in each partition.
 - In e-Stat LOD, the distinct number of predicates is 144.
