

An Oracle White Paper
February 2011

Optimizing Storage for Oracle E-Business Suite Applications

Executive Overview

Enterprises are experiencing an explosion in the volume of data required to effectively run their businesses. Every organization today must provide fast access to vast amounts of enterprise data for their customers, partners and business users. As a result the volume of information is constantly increasing leading to the information explosion. Oracle Applications also now allow customers to store data in various formats that includes documents, images, spatial information and etc.

Exponential increases in data volumes in recent years have put enterprise IT infrastructures under severe pressure – from a cost, performance, scalability and manageability perspective. It has become imperative to employ more efficient ways of storing and managing data to meet the growing demands being placed on IT systems. In addition, application scalability and performance must continue to meet the demands of the business – even as data volumes and the complexity of data managed explode.

Increased performance and ease of data management with Oracle Partitioning

Partitioning allows a table, index or index-organized table to be subdivided into smaller pieces. Each piece of a database object is called a partition. Each partition has its own name, and may optionally have its own storage characteristics. From the perspective of a database administrator, a partitioned object has multiple pieces, which can be managed either collectively or individually. This gives the administrator considerable flexibility in managing the partitioned object. However, from the perspective of the application, a partitioned table is identical to a nonpartitioned table; no modifications to application queries are necessary when accessing a partitioned table.

Partitioning can provide tremendous benefits to a wide variety of applications by improving manageability, performance, and availability. It is not unusual for partitioning to improve the performance of certain queries or maintenance operations by an order of magnitude. Moreover, partitioning can greatly reduce the total cost of data ownership, using a “tiered archiving” approach of keeping older relevant information still online on low cost storage devices.

The Oracle Database 11g Partitioning option provides the most comprehensive set of partitioning strategies, allowing an enterprise to optimally align the data subdivision with the actual business requirements. IT administrators can implement Information Lifecycle Management (ILM) protocols by partitioning data and moving historical data to low-cost storage. Partitioning can be used to obtain

better concurrency as well as to decrease the number of rows to be processed through partition pruning and partition-wise joins.

Oracle Partitioning Option with Oracle E-Business Suite

E-Business Suite release 11i and Release 12 are certified with the Oracle Database 11g Partitioning Option. The Oracle E-Business Suite uses partitioning out-of-the-box with the following modules:

- Advanced Planning and Scheduling
- Payables (Trial Balances)
- Projects Resources
- Workflow
- Directory Services
- Daily Business Intelligence
- HR (Employee Directory)
- Engineering
- and other products...

In cases where an Application table has a natural and logical partition key and the majority of the runtime access path (of the standard product) is based on this natural partition key, Oracle Applications will investigate delivering the table as a partitioned table as part of the standard installation.

Many E-Business Suite tables do not have a natural partitioning key which would apply to all customers, simply because the data distribution and access path is highly dependent on each customer's functional implementation. However, the customers are free to partition the tables in a logical manner based on their own requirements.

See the following websites and notes for additional information on Best Practices when using Oracle Partitioning with the Oracle E-Business Suite:

Maximize resource utilization and reduce costs with the Oracle Advanced Compression Option

“Oracle technology had a big impact on how we manage our mission-critical data. Through compression, we are using one-tenth as much storage space as before.”

– **Jacek Sosnia**, Atomic Data Warehouse Technical Platform Engineer, Procter & Gamble

The Oracle Database 11g Advanced Compression Option introduces a comprehensive set of compression capabilities to help customers maximize storage utilization and reduce costs. It allows IT administrators to significantly reduce their overall database storage footprint by enabling compression for all types of data – relational (OLTP table compression), unstructured (SecureFiles Compression and Deduplication), network (Data Guard Redo Transport) and backup (RMAN and Data Pump) data.

Although storage cost savings are often seen as the most tangible benefit of compression, innovative technologies included in the Advanced Compression Option are designed to reduce resource requirements and technology costs for a number of components of your IT infrastructure, including memory and network bandwidth. A brief description of each Advanced Compression capability is outlined below.

OLTP Table Compression

Oracle’s OLTP Table Compression uses a unique compression algorithm specifically designed to work with OLTP applications. The algorithm works by eliminating duplicate values within a database block, even across multiple columns. The compression ratio achieved in a given environment depends on the

⁵ <http://www.oracle.com/us/corporate/customers/athens-international-snapshot-152688.pdf>

nature of the data being compressed, specifically the cardinality of the data. In general, E-Business Suite customers can expect to reduce their storage space consumption by a factor of 2x to 4x by using OLTP Table Compression. That is, the amount of space consumed by compressed data will be two to four times smaller than that of the uncompressed data.

The benefits of OLTP Table Compression go beyond just on-disk storage savings. One significant advantage is Oracle's ability to read data in compressed blocks directly without having to first uncompress the block. Therefore, there is no measurable performance degradation for accessing compressed data. In fact, in many cases performance will improve due to the reduction in I/O since Oracle will have to access fewer blocks. Furthermore, the buffer cache will become more efficient by storing more data without having to add memory.

SecureFiles Compression and Deduplication

SecureFiles, a feature introduced in Oracle Database 11g Release 1, offers a 'best-of-both-worlds' architecture for storing semi-structured and unstructured content, such as documents, spreadsheets and XML files. SecureFiles is specifically engineered to deliver high performance for file data comparable to that of traditional file systems, while retaining the advantages of the Oracle database. SecureFiles is designed as a superset of the ANSI standard LOB data type and offers easy migration from existing BasicFiles LOBs, the precursor to SecureFiles.

The Advanced Compression Option has two storage optimization features that can be leveraged with SecureFiles. The first feature, SecureFiles Deduplication, is an intelligent technology that eliminates duplicate copies of SecureFiles data. Oracle stores one copy of the SecureFiles LOB and replaces the duplicate copies with references to the first copy. Consider an application where 10 users store an identical 1MB document in the system. Without SecureFiles Deduplication, the system would store one copy of the file for each of the 10 users – requiring 10MB of storage. If the application uses SecureFiles with Deduplication, it will store the 1MB attachment just once. That's a 90% savings in storage requirements.

The second feature, SecureFiles Compression, utilizes industry standard compression algorithms to further minimize the storage requirements of SecureFiles data. With SecureFiles compression, typical files such as documents or XML files experience a reduction of 2x to 3x in size. Using built-in intelligence, SecureFiles Compression automatically avoids compressing data that would not benefit from compression – for instance a document that was compressed via a 3rd party tool before being inserted into the database as a SecureFiles file. With three levels of compression available - LOW, MEDIUM and HIGH - users can determine the optimal storage savings and compression CPU overhead for their environment. SecureFiles compression can result in huge storage savings for applications storing unstructured data inside the database.

Additional compression features in the Advanced Compression Option include:

- Backup Data Compression – the Advanced Compression Option includes RMAN compression technology that can dramatically reduce the storage requirements for backup data. Due to RMAN’s tight integration with Oracle Database, backup data is compressed before it is written to disk or tape and doesn’t need to be uncompressed before recovery – providing an enormous reduction in storage costs. Similarly, the data and metadata generated by Data Pump exports can be compressed with Advanced Compression
- Network Traffic Compression – the Advanced Compression Option offers the capability to compress Oracle Data Guard (standby databases) redo data as it is sent over the network -- reducing network bandwidth consumption and in some cases reducing the transmission time of redo data.

To see how Oracle Advanced Compression can save your organization storage resources, download the Oracle Advanced Compression Advisor. A [free download](#)⁶ is available from OTN.

The Oracle Advanced Compression Advisor provides an estimate of potential storage savings that can be realized through the use of the OLTP Table Compression feature. This estimate is based on analysis of a sample of data and provides a good estimate of the actual results you may obtain once you implement OLTP Table compression in your environment.

Oracle Advanced Compression with Oracle E-Business Suite

E-Business Suite release 11.5.10 and Release 12 are certified with Oracle Database 11g Advanced Compression Option.

See the following websites and notes for more information on best practices when using Oracle Advanced Compression Option with Oracle E-Business Suite:

[Oracle's Internal E-Business Suite Implementation & Advanced Compression podcast](#)¹⁰

Oracle itself has saved more than 68 TB across its Oracle E-Business Suite implementation. Oracle has been using the Advanced Compression Option with E-Business Suite Release 12 in its Oracle Global Single Instance (GSI) production environment since 2009, with the following results:

- Reduced EBS 12 database size from 17 Terabytes to 13 Terabytes
- Compressed ~260 tables and over 700 associated indices and LOBs after migrating to SecureFiles
- Total space saved: 68 TB across primary, standby, and associated test beds

Conclusion

By partitioning databases based on the lifecycle of the information managed and compressing historical data, IT departments can reduce their dependency on high end storage, reduce their incremental storage costs, keep more data online for longer periods of time and improve the performance of applications that access large databases.

The Oracle Advanced Compression and Oracle Partitioning Options, together, provide IT departments, running Oracle Applications, cost-effective information management by better optimizing storage infrastructures while also maintaining the performance and scalability that businesses require.
