

Power Pack Grid Themes Extension

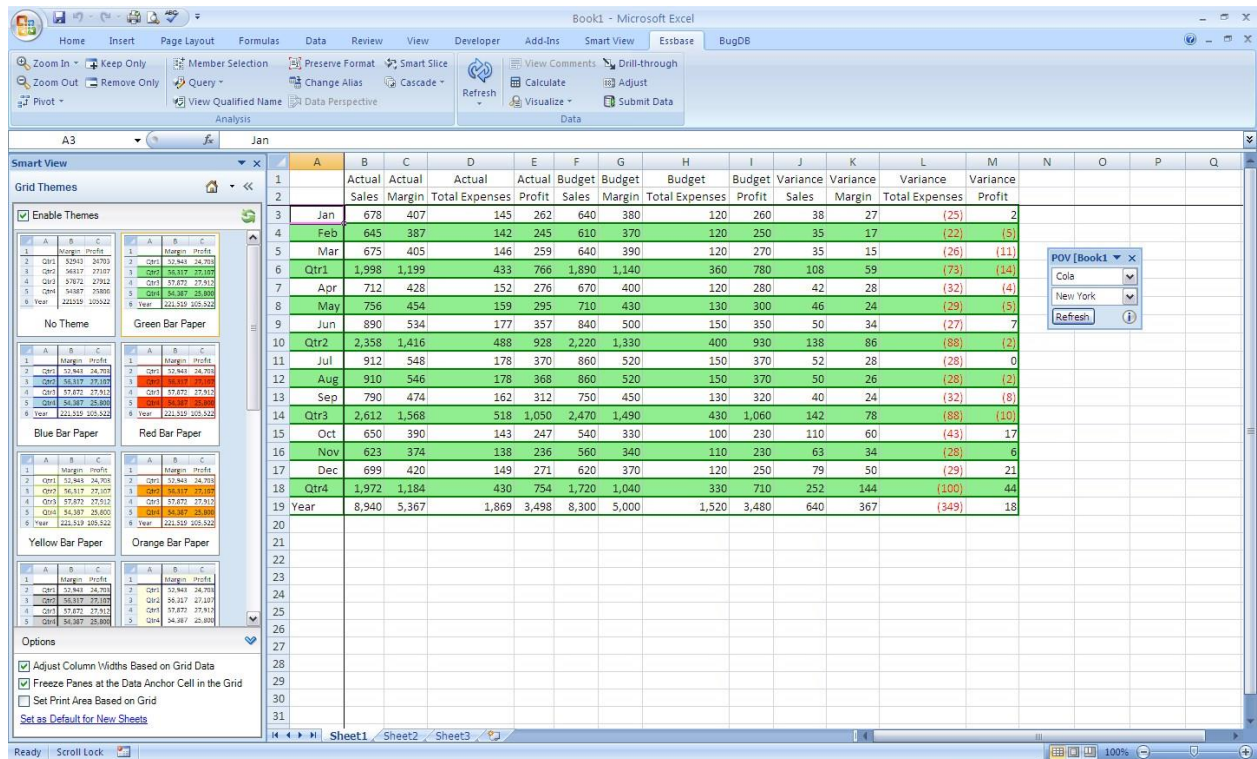

Installation

Launch (double click) the “.svext” installation on a Windows machine with Smart View 11.1.2.5.210 or above installed along with Office 2007 and Office 2010. The extension will be installed in the user’s application data folder with no additional user interaction required unless the installation fails.

Note: Smart View 11.1.2.5.210 or above is required for this extension to work.

Usage

The Power Pack Grid Themes extension allows users apply formatting to grids they are working out while performing operations like zoom and pivot. From the Smart View Panel Home dropdown select ‘Grid Themes’ and a panel will be displayed that allows you to select from various themes and select various options like auto adjust column widths, set the print area based on the grid and freeze panes at the data anchor cell.

Themes selections are saved with the workbook so if you send a workbook to another user as long as they have this extension installed the same theme will appear for them.
