

Oracle Public Safety for Campus

One operational picture. Every team ready to act.

Connected safety operations for frontline, command, and leadership teams

When safety is on the line, adding systems alone does not provide more control. Critical information can be spread across visitor records, live video, access systems, incident updates, reports, and partner applications— leaving teams to piece together the story while conditions change. Separate searches and handoffs can delay action, blur accountability, and leave teams with an incomplete picture.

Oracle Public Safety for Campus connects the information, people, and actions to help manage an incident from alert to closure. Built for data centers, universities and schools, and law enforcement agencies, it gives frontline teams, operators, supervisors, and leaders shared context to understand risk, direct resources, and coordinate with confidence.

Command the response when an event requires it

- **Real-time incident management:** Turn alerts into coordinated action with Oracle Command Center. Set preconfigured incident types and priorities, assign security resources, and share real-time text comments to help teams direct resources, identify the next action owner, and track progress through closure
- **Mobile responder app:** Mobile CAD puts incident details, maps, and CAD notes within reach while responders are on scene or away from the vehicle
- **Incident reporting:** Incident records and reporting preserve what happened and how the response unfolded, supporting accountability, after-action review, and continuous improvement

Get a 360-degree view of emerging incidents

- **See the situation as it develops:** View live video from fixed security cameras to help assess what is happening and make informed decisions as conditions change—all within the broader operational picture
- **Bring in signals:** Integrate sensors and devices with public APIs to create security alerts and incidents
- **Seamless handoff to first responders:** Share access to live video feeds with law enforcement and other first responders during critical security incidents

Know who is on site and what matters

- **Built-in visitor management:** Manage on-site visitors alongside security operations with integrated person history, visit scheduling, and simple check-in. Connect visitor management and on-site awareness with information about people and vehicles
- **Real-time presence detection:** Wireless beacons and sensors provide visibility into who is on site and where visitors are located, helping teams quickly identify unauthorized access and review visitor movements throughout their stay

Use alongside Oracle Radio

- Teams can engage in an incident using the device that best fits the situation. With Oracle Radio, communications and incident details come together on one device

Extensible security operations

- **Public APIs:** With open APIs, Oracle Public Safety for Campus can extend to support evolving operational needs. The open platform can help teams share relevant data with third-party products and support AI-assisted workflows where available. Teams can connect the tools and integrations that support their operation, with teams retaining responsibility for critical decisions and escalations
