

Oracle Communications Core Session Manager

Start the evolution to Network Function Virtualization (NFV) today with Oracle Communications Core Session Manager. Oracle Communications Core Session Manager is an agile session core for supporting Voice over LTE (VoLTE), Voice over WiFi (VoWiFi), Rich Communications Services (RCS), fixed-network modernization, over-the-top (OTT) service integration and more. Oracle Communications Core Session Manager is designed from the ground up to be 100% virtualized and fully orchestrated aligned with NFV framework.

KEY BUSINESS BENEFITS

- Immediate entry point for Network Function Virtualization efforts – start virtualizing real time session delivery today
- Fully complements existing Oracle Communications Session Border Controller investments
- An extensible solution that easily scales from as little as a few thousands to tens of millions of subscribers

KEY FEATURES

- Fully virtualized solution available on commercial hypervisors
- Core session control functions S-CSCF, I-CSCF
- Session routing – BGCF
- Dynamic load balancing support
- Support for 3GPP IMS-AKA authentication mechanism
- Routing control with ENUM interface support and preferential routing based on User Equipment capabilities
- Advanced SIP Header Manipulation Rules and DIAMETER Manipulation Rules for increased interoperability

Overview

Core session management functions play a critical role as the central control point that directs signaling flows through the network and between elements. Network Function Virtualization (NFV) allows service providers to efficiently share hardware resources across different services and customers. It enables operators to more effectively manage multifaceted, multi-vendor networks, rapidly launch new services and easily reallocate resources without purchasing new equipment and coordinating expensive onsite installation teams. The Oracle Communications Core Session Manager is designed to fully support core session management capabilities in virtualized environments. It provides a complete set of session core functions including IP Multimedia Subsystem (IMS) Call/Session Control Functions (CSCF) and Break-out Gateway Control Function (BGCF) and their associated 3GPP interfaces.

Telecom networks are undergoing multiple technology and service transitions. Oracle Communications Core Session Manager is built around agile principles, allowing service providers to easily adjust, adapt, and leverage core session management for the dynamic needs of today and tomorrow. Oracle Communications Core Session Manager is built on a nimble signaling core for maximum interoperability and service flexibility without sacrificing reliability. Oracle Communications Core Session Manager compliments Oracle Communications infrastructure elements and is available as a pre-configured solution with Oracle Communications Session Border Controller and the Oracle Communications Virtualized VoLTE solution. Oracle Communications Core Session Manager is also fully functional with Oracle's third-party ecosystem partners, including database, policy, application server, and charging vendors. Combined with the Oracle Communications Application Orchestrator for Virtual Network Function management and the Oracle Communications Network Orchestration Solution for full network and service orchestration the Oracle Communications Core Session Manager allows service providers to reap the full benefits of service agility offered by NFV.

ORACLE NFV ORCHESTRATION FRAMEWORK

An industry-defining approach to NFV that orchestrates services, applications and network elements with guidance from policy management and insights from real-time analytics.

RELATED PRODUCTS

The following Oracle products are part of the NFV Orchestration Framework:

- Oracle Communications Application Orchestrator
- Oracle Communications Network Service Orchestration Solution

Network Function Virtualization

Network Function Virtualization (NFV) is a widely supported ETSI industry specifications group initiative. NFV's primary goal is to deploy and deliver software-based functions and services. It does this by consolidating disparate equipment types on standard high volume commercial hardware while leveraging standard IT virtualization technologies. With this standardized virtualization framework, NFV aims to:

- Provide service agility
- Increase the speed of innovation
- Share resources across services
- Finely tune service introduction
- Encourage an open ecosystem
- Reduce equipment cost

Built for Virtualization

Leveraging Oracle's many years of experience designing virtualized products, Oracle Communications Core Session Manager is designed from the start to run in a fully virtualized environment and is in full alignment with ETSI NFV's in-progress standards. With an underlying Acme Packet OS enhancement to symmetrical multi-processing environments (SMP), the Oracle Communications Core Session Manager can fully utilize multi-core platform design and architectures multiple underlying hardware platforms thereby delivering enhanced performance and capacity for OCCSM virtualized node. OCCSM architecture is designed to handle dynamic resource allocation (vCPU/vIO/vMem) in virtualized environments. OCCSM is designed to be hypervisor agnostic. It currently supports Oracle Virtual Machine (OVM) 3.2.1 and higher, as well as other popular hypervisors such as KVM and VMware. The Oracle Core Session Manager also runs on COTS hardware including the Sun Netra X3-2 and Netra X5-2

Rapid path to NFV

Oracle Communications Core Session Manager provides a fast path to NFV with the industry's first production-ready, 3GPP-compliant virtualized session core. It allows Communications Service Providers to start realizing immediate benefits of NFV while evolving media performance critical elements over time. Oracle Communications Core Session Manager is a key part of Oracle's NFV framework and evolution path. It also advances the Oracle Communications Intelligent Orchestration Framework, an industry-defining approach to NFV that orchestrates services, applications and network elements with guidance from policy management and insights from real-time analytics.

Elastic Scalability

Oracle Communications Core Session Manager aligns with NFV's elastic scalability principles. Combined with Oracle Communications Session Border Controller and Oracle Communications Subscriber-Aware Load Balancer, a virtualized Oracle Communications Core Session Manager core can scale from as little as a few thousands to tens of millions of subscribers.

NETWORK SESSION DELIVERY AND CONTROL INFRASTRUCTURE

Oracle's network session delivery and control infrastructure enables enterprises and service providers to manage the many challenges in the delivery of IP voice, video, and data services and applications. Service provider solutions are deployed at network borders and in the IP service core to help fixed-line, mobile, wholesale, and over-the-top service providers optimize revenues and realize long-term cost savings. In the enterprise, session delivery infrastructure solutions seamlessly connect fixed and mobile users, enabling rich multimedia interactions and automating business processes for significant increases in productivity and efficiency.

The following Oracle products are part of the network session delivery and control infrastructure:

- Oracle Communications Session Border Controller
- Oracle Communications Session Router
- Oracle Communications Subscriber-Aware Load Balancer
- Oracle Communications Security Gateway
- Oracle Communications Interactive Session Recorder
- Oracle Communications Application Session Controller
- Oracle Communications Core Session Manager
- Oracle Communications WebRTC Session Manager
- Oracle Communications Session Delivery Management Suite

NFV Orchestration

The Oracle Communications Core Session Manager combined with the Oracle Communications Application Orchestrator and Network Service Orchestration Solution allows CSPs full service automation. This allows planning, engineering and operations teams in CSPs to rapidly deploy new network services and functions which materially reduces operational effort and cost.

Agile Session Management Platform

In today's dynamic market environment, the ability to quickly deploy, scale, and repurpose infrastructure assets are critical. Oracle Communications Core Session Manager was architected with agile principles in mind to provide maximum flexibility without sacrificing standards compliance and rapid deploy-ability.

Flexible Signaling Engine

Oracle Communications Core Session Manager provides a comprehensive signaling platform based on the field proven Acme Packet OS. It provides robust interoperability in real-time with its granular SIP manipulation abilities. Its signaling engine is also fully programmable with scripting support, allowing for more advanced session control and pragmatic session flow options. This robust field programmability helps to virtually guarantee interoperability with current and future SIP-based infrastructure elements in IMS and non-IMS environments including application servers, media servers, media gateways, SBCs and other CSCFs. For improved performance and manageability and reduced latency, Oracle Communication Core Session Manager provides routing control with ENUM interface support and preferential routing based on User Equipment capabilities. The Oracle Communications Core Session Manager enhances network resiliency by supporting Stream Transmission Control Protocol (SCTP). It can communicate with the HSS using either Diameter over SCTP or TCP protocol based on the configuration. It also provides IPv4 and IPv6 interworking support for various interfaces, including Diameter interfaces. By extending support to standard interfaces, Oracle Communications Core Session Manager is a central part of IMS ecosystem and works well with other products such as home subscriber databases, application servers and over-the-top (OTT) clients.

Dynamic Load Balancing

Oracle Communications Core Session Manger enables a single point of IP presence and uniform load balancing for service invocation in a clustered environment for VMEs and software instances within data centers. Subscriber Load Balancer and Route Manager (SLRM) is a SIP aware load balancer, which provides a single IP entry point to Oracle Communications Core Session Manager clusters. It also provides session based routing capabilities and dynamic discoveries of Oracle Communications Core Sessions Managers in a virtualized environment.

Centralized Database

Oracle Communications Core Session Manager supports a centralized subscriber database deployment. Using its Cx Diameter interface, HSS elements can be queried for network operation procedures such as subscriber authentication, service

orchestration rules (for example, initial filter criteria), and serving CSCF assignment and lookup.

Multiple Authentication Options

Oracle Communications Core Session Manager provides a number of authentication options, providing a wide range of capabilities for interfacing with older systems and newer OTT-based networks. It supports SIP DIGEST method for authentication in IMS and SIP-based networks. Oracle Communications Core Session Manager provides enhance security in IMS by supporting the 3GPP based IMS-AKA (Authentication and Key Agreement) authentication mechanism, which is based on a long-term secret key, shared between the IP Multimedia Services Identity Module (ISIM) and home network's Authentication Centre (AUC).

Epicenter of the Oracle Communications Infrastructure

Oracle Communications Core Session Manager fully compliments existing Oracle Communications Session Border Controllers. It can augment the Oracle Communications Session Border Controller's Proxy and Emergency Core Session Control Functions (P/E-CSCF) at the edge with the Serving and Interrogating CSCF (I/S-CSCF) in the core with standards compliant interfaces for connecting to Application Servers, Subscriber Databases, and Interconnect networks. Oracle Communications Core Session Manager is available as a pre-integrated solution with the Oracle Communications Session Border Controller, providing a rapidly deployable solution that leverages Oracle Communications Session Border Controller's field-proven security, reliability, interoperability, and regulatory compliance features. Oracle Communications Core Session Manager provides the critical core session management functions required to tie together Oracle's other network session delivery infrastructure products. Combined with other Oracle Communications products, Oracle Communications Core Session Manager completes a comprehensive session delivery solution for classic IMS, pre-IMS, and OTT-oriented networks. Oracle Communications Core Session Manager is also fully functional with Oracle's third-party network session delivery and control infrastructure ecosystem partners.

Complete Core Session Management

Oracle Communications Core Session Manager combined with Oracle Communications Session Border Controller provides a complete session management solution. Oracle Communications Core Session Manager offers a full set of 3GPP release 12 compliant functions and interfaces and is complimented by a management and support system, real-time service monitoring, and implementation services.

3GPP IMS Compliant Functions and Features

Oracle Communications Core Session Manager is fully 3GPP compliant with all core session and breakout gateway functions and interfaces. A list of these functions and interfaces is shown below.

SUPPORTED 3GPP IMS FUNCTIONS AND INTERFACES

Function	Definition	Description
S-CSCF	Service Call Session Control Function	Core session control proxy and registrar
I-CSCF	Interrogating Call Session Control Function	Core routing proxy, determines S-CSCF instance for registration
BGCF	Breakout Gateway Control Function	Core session routing with the IMS network and to external interconnect border

Interface	Definition	Description
Cx	Interface to HSS database	Diameter authentication, authorization, location update and lookup
Rf	Interface to offline charging system (OFC)	Diameter charging control
Mx	Interface to I-BCF	SIP interface to interconnect with outer IMS networks
ISC	Interface to AS	SIP interface from S-CSCF to application server
Mi	Interface to BGCF	SIP interface for signaling to Public Switched Telephone Network (PSTN) or other IMS networks
Mj/Mg	Interface to MGCF	SIP interface for sending signaling to PSTN
Mw	Interface to Access-SBC/P-CSCF	SIP interface for connection to access networks

Management and Support Systems

Oracle Communications Core Session Manager supports comprehensive embedded management via secure console. Telnet, SSH, FTP, SFTP, SNMP, RADIUS, NTP and the local Command Line Interface (CLI) provides access to SNMP MIBs, historical and call data records, system configuration, protocol trace and debug, real-time log viewing, syslog, file management, software updates and more. OCCSM integrates the Oracle Communications Operations Monitor (OCOM) feature for improved network monitoring thereby reducing operations costs and increasing user satisfaction. Combined with the Oracle Communications Session Delivery Manager family of products Communications Service Providers can expect end-to-end call correlation and analytics in real-time.

Professional Services

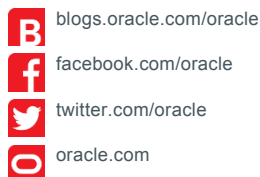

Oracle's integration service for Oracle Communications Core Session Manager is a robust deployment service that offers customers a thorough and streamlined design and implementation of Oracle's network session delivery and control infrastructure solutions. It combines an array of Oracle professional services offerings into a single service solution, including pre-installation planning, project management, solution architecture and design, solution testing and certification, onsite implementation, and post-implementation remote consulting.
