
Oracle Communications Security Gateway MCX300– IP.access nano3G AP561.2.0 technical Application Note

Technical Application Note

Disclaimer

The following is intended to outline our general product direction. It is intended for information purposes only, and may not be incorporated into any contract. It is not a commitment to deliver any material, code, or functionality, and should not be relied upon in making purchasing decisions. The development, release, and timing of any features or functionality described for Oracle's products remains at the sole discretion of Oracle.

Table of Contents

Intended Audience

This document is intended for use by Oracle Sales Consultants, Engineers, third party Systems Integrators, and end users of the Oracle Communications Security Gateway product. It assumes that the reader is familiar with basic operations of the Oracle Communications Acme Packet 4500 platform.

Document Overview

This technical application note documents the Oracle Communications Security Gateway (OCSG) and IP.access nano3G Integration and interoperability testing. It should be noted that while this application note focuses on the optimal configuration between Oracle Communications Security Gateway and the ip.access nano3G UTRAN system, production environments in different customer networks will have additional configuration parameters that are specific to other applications.

Introduction

IP.access – Oracle Communications Partnership

Ip.access integrates and supports the Oracle Communications Security Gateway as part of its complete nano3G femtocell and picocell solution. The OCSG fulfills the security gateway functional requirements defined in 3GPP, providing authentication and IPsec tunnel management between nano3G Access Points and the Access Controller.

Ip.access nano3G small cells generate high-quality 3G signals indoors and use broadband IP backhaul for rapid deployment, low-cost operation while offloading macro traffic. The combined solution delivers on all the benefits of small cells–improved customer experience and reduced macro network costs–with security, manageability and reliability.

Oracle Communications Security Gateway

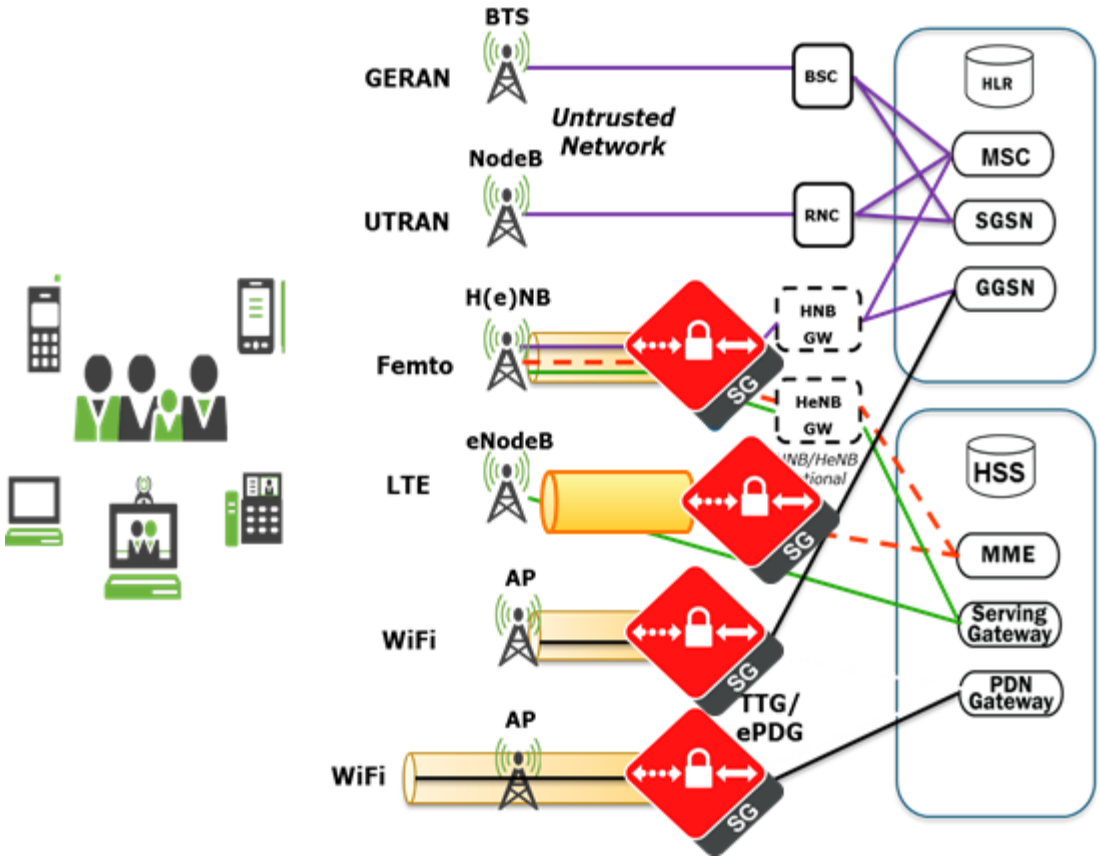
Oracle Communications Security Gateway is a high performance tunneling gateway for heterogeneous networks, enabling fixed mobile convergence and offload macro Radio Access network traffic. It secures the core networks of service providers from untrusted internet access to local femtocells, evolved Home Node Bs (LTE femtocells) and Wi-fi devices. Oracle Communications Security Gateway is supported on the Acme Packet 4500 platform. It leverages the industry leading Acme Packet OS software platform to offer security gateway capabilities – large scale IPsec tunnel termination from femtocells and Wi-Fi devices into mobile operator core.

The security gatewayis typically deployed in operator's Core network and is based on industry standards and fulfills the following functional elements defined by Third Generation Partnership Project (3GPP) and

Third Generation Partnership Project Two (3GPP2):

- Interworking-Wireless Local Area Network (I-WLAN) Tunnel Terminating Gateway (TTG)
- Home NodeB (HNB) Security Gateway
- Femtocell Security Gateway
- Evolved Packet Data Gateway (ePDG)

Role of the Security Gateway in Mobile Networks



Application Overview

Security gateway provides secure integration from RAN to Mobile Core. The role of Security Gateway can be elaborated:

Integrated Small Cell and WiFi with Mobile Core

- EAP authentication
- Seamless hand-overs

Secure RAN to Mobile Core

- Integrate with Oracle PCRF, SBC, IMS solutions

Enforce QoS

- Low latency, PCRF integration

Comprehensive security

- IPsec tunnels with rich authentication suite and encryption models
- DOS/DDOS protection

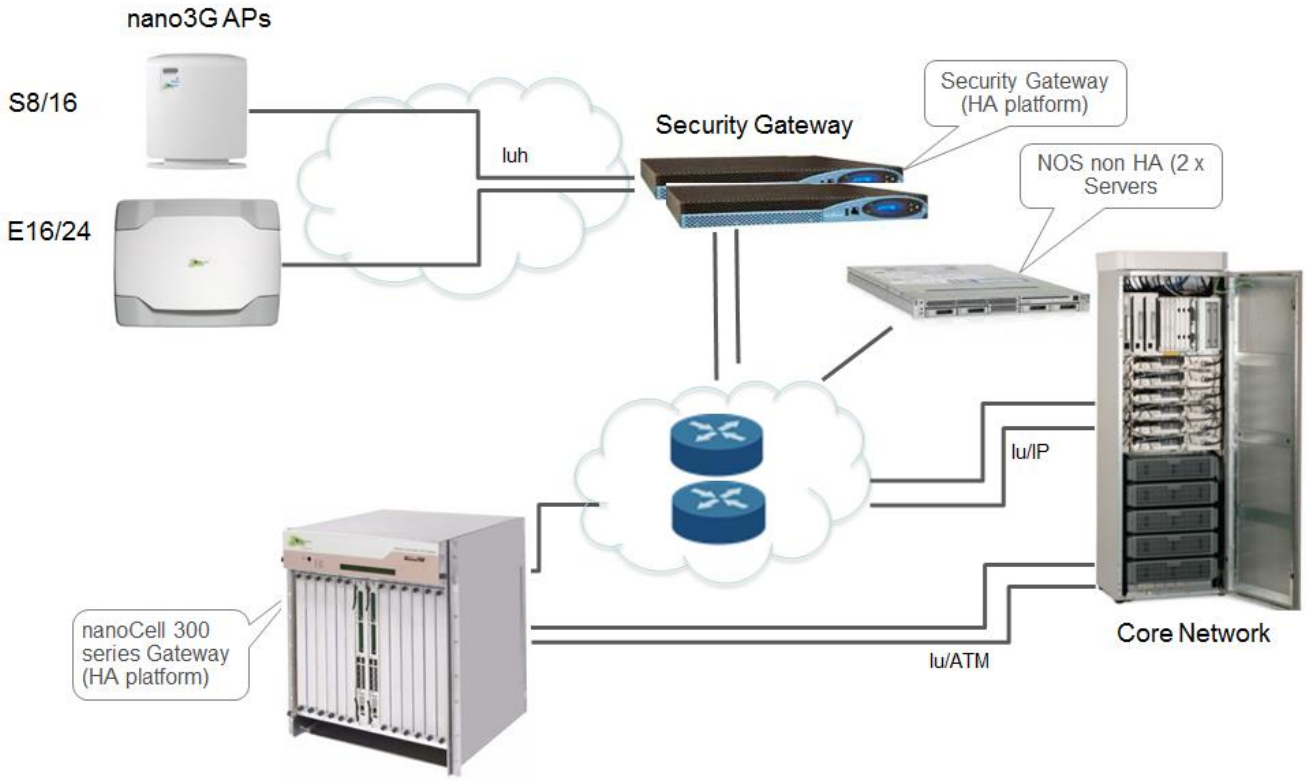
Simplified integration and service flexibility

- Support different topologies and 3GPP functional elements (WAG, ePDG, SeGW), can be deployed close to cell sites/access points to improve radio efficiency by limiting packet loss and retransmissions
- Local Break-out of traffic, Integration with AAA, Mobile Core
- Support IPv6 and v6 address families, routing protocols, tunneling technology

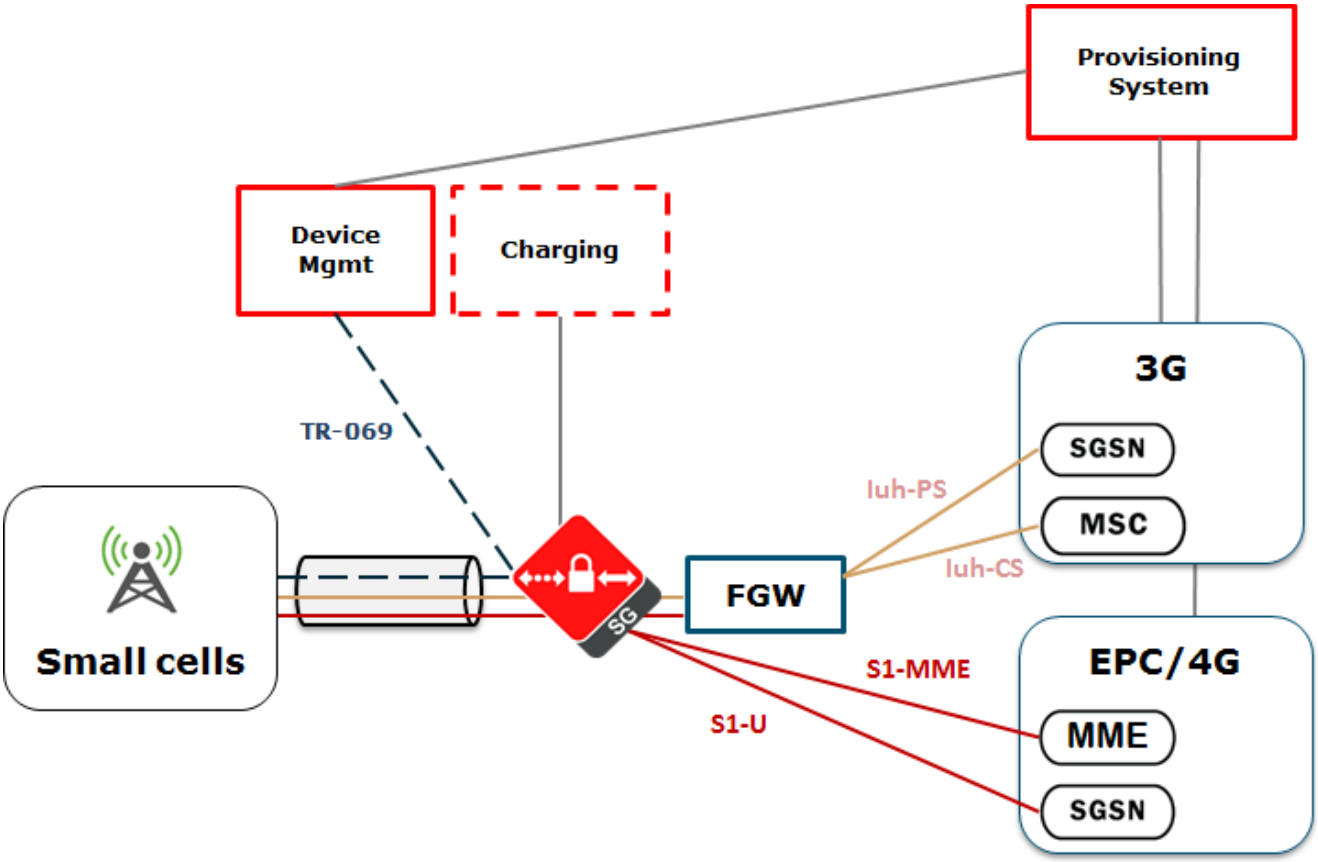
Compact and powerful

- High tunnel processing (10K's -100K's per 1RU)
- Non-blocking data path for low latency (VoLTE, gaming, real-time 2-way video)
- High availability for service continuity

Ip.access NC300 Architecture



Small Cell Architecture



Functional Overview of OCSG features and configuration in ip.acccess Small Cell solution

Authentication

The OCSG supports device authentication under the IKEv2 framework. Device authentication is initiated by the endpoints or AP towards the user-facing IKE interface of the OCSG. There are many different modes of authentication in the IKEv2 framework and

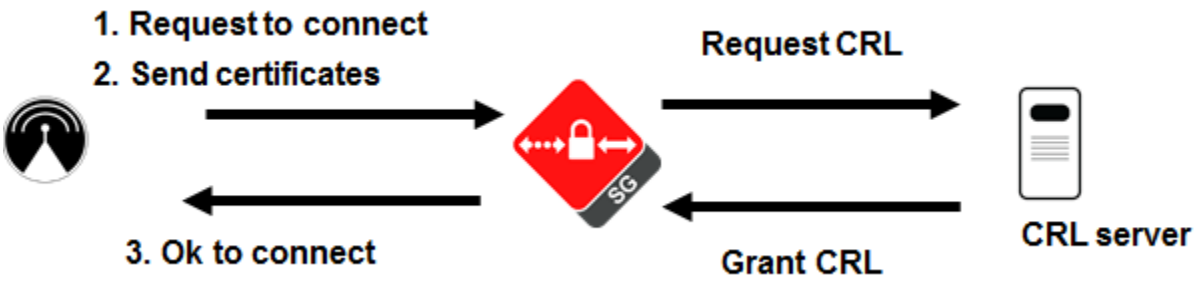
ip.access solution utilizes the Certificate based authentication mode with X.509v3 certificates. An overview of the mechanism is provided below:

Certificate authentication (mutual)

With X.509v3 certificate mutual authentication, the endpoint and security gateway authenticate each other. The OCSG offers a certificate to the endpoint that has been signed by the CA (Certificate Authority) so that the endpoint/AP can verify the identity of the OCSG. The endpoint then utilizes the root certificate of the CA to validate the OCSG's certificate. This operation ensures endpoint that it is connecting to a valid OCSG.Now to verify whether the AP/endpoint is genuine or not, the endpoint/AP offers a certificate signed by the CA and the OCSG validates the endpoint with the OCSG's root certificate of the CA. Sample configuration is provided in Appendix A of this document. (certificate-record and ike-certificate-profile and ike-certificate-profile-id-list in ike-interface)

Certificate Revocation List

An alternative to utilizing Online Certificate Status Protocol (OCSP) to verify the endpoint certificate validity when performing mutual certificate authentication, is to utilize CRL (RFC 3280) to validate the public key certificate of an endpoint. With CRL support, the OCSG loads a list that contains the certificates of the revoked endpoints. When the endpoint offers its certificate for validation to the OCSG, the OCSG checks the certificate against the list in the CRL, and if there is a match, the endpoint is not allowed to establish an IPsec tunnel towards the OCSG. If there is no match against the CRL, then the OCSG allows the IPsec tunnel establishment to succeed. Ip.access deployments use this feature of the security gateway. A diagram of the exchange process in CRL is given below:



Sample configuration is below:

```
cert-status-profile
       name                              IPAoemCRL
       ip-address                        10.m.n.p
```

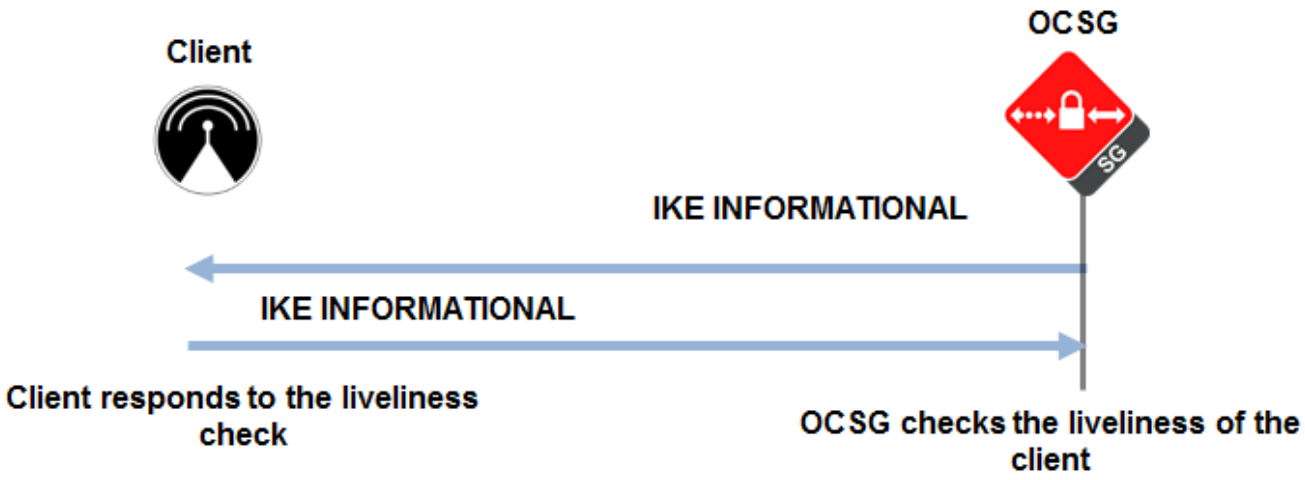
```
       hostname
       port                            80
       type                            CRL
       trans-proto                     HTTP
       requestor-cert
       responder-cert                  IPAoemCert
       realm-id                        Core1
       retry-count                     3
       dead-time                       0
       crl-update-interval             86400
       crl-list
/crl/crl.ipaccess.com/ipaccessltd_oemca_101_100.crl

ike-interface
       address                         e.f.g.h0
       realm-id                        Access1
       ike-mode                        responder
       local-address-pool-id-list      LocalPool1
       dpd-params-name                 DpdParams1
       v2-ike-life-secs                259200
       v2-ipsec-life-secs              43200
       v2-rekey                        enabled
       multiple-authentication         disabled
       multiple-child-sa-mode          none
       shared-password
       eap-protocol
       addr-assignment                 local
       sd-authentication-method        certificate
       certificate-profile-id-list     <fqdn>
       threshold-crossing-alert-group-name
       cert-status-check               disabled
       cert-status-profile-list        IPAoemCRL
       access-control-name
       accounting-param-name
       traffic-selectors               10.0.0.0/8
       ip-subnets
       authorization                   disabled
```

Dead Peer Detection

Dead Peer Detection (DPD) enables the detection of endpoints that have stale, or unused, IPsec tunnels. The OCSG acts as both a DPD responder, as well as a DPD initiator. As a DPD responder, the IPsec endpoint sends the INFORMATIONAL request (defined in RFC 4306) with no payloads (other than the empty Encrypted payload required by the syntax) to the OCSG to check liveness of the OCSG. The OCSG replies to these messages. As a DPD initiator, the OCSG sends the INFORMATIONAL request

with no payloads (other than the empty Encrypted payload required by the syntax) to check the liveness of the endpoint. A diagram of the DPD message exchange is provided below:



Sample configuration is below:

```
dpd-params
        name                            DpdParams1
        max-loop                        100
        max-endpoints                   25
        max-cpu-limit                   60
        load-max-loop                   40
        load-max-endpoints              5
        max-attempts                    1
        max-retrans                     0
```

Lab Configuration and Software/Hardware Tools

The test environment consisted of the following components:

- Oracle Communications Security Gateway
- Ip.access Nano3G Small cell Access point and Controller

The following tables provide the software hardware versions used for the elements:

Oracle Communications Security Gateway System Specifications

Hardware	Acme Packet 4500 platform with ETC2 10G NIU
Software Release	nnMCX300m2p1.tar
Software modules enabled	Security gateway, IKE tunnels (200000 tunnels)

Ip.access Nano3G Small cell Access Point and Controller System Specifications

Hardware	Nano-16 3G AP (NodeB)
Software Release	N3G_2.0.5 (AP561.2.0)
Access Controller Hardware	nano3G AC (RNC) Version - N3G_2.0.5(SR2.0.0-138.0)
3G MSC/ SGSN	NG40

Test Cases

The purpose of this testing was to verify the correct implementation of interface between ip.access nano3G UTRAN and ACME Security Gateway.

The following main areas were covered during IOT:

- IPsec & Traffic/data pass through
- Standalone
- Redundancy

This section gives a one-line description of each test case. For each test case the appropriate Result is given as defined below.

Passed (P): All parties agree that the test case has met all the requirements defined in the test case description.

Conditionally Passed (P*) : All parties agree that the test case has met the requirements defined in the test case description, however; a comment is included to clarify the behavior witnessed during the test.

Failed (F): All parties agree that the test case has not met the criteria specified in the test case description.

Not Possible (NP): The test case was not performed

Not Triggered (NT): The test case could not be triggered

Under test (UT): The test case couldn't be concluded in the current session

Total number of test cases: 20

Test cases

IPsec & Traffic

Test ID	IPsec & Traffic	Result	Comments
ACME_AP_01	Demonstrate that the AP can connect through the Security Gateway to the AC and that UEs can make CS calls and PS calls	**P**	
ACME_AP_02	Set up an IPsec tunnel between an AP and the Security Gateway using “Real” Certificates in both the AP and the Security Gateway.	**P**	
ACME_AP_03	Set up an IPsec tunnel between an AP and Security Gateway using Test Certificates in both the AP and the Security Gateway.	**P**	
ACME_AP_04	Demonstrate that the Security Gateway works with its certificate containing an FQDN.	**P**	
ACME_AP_05	Demonstrate that the Security Gateway works with its certificate containing an IP address.	**P**	
ACME_AP_06	Demonstrate that the IPsec tunnel conforms to the IPsec profile (e.g. uses AES-128 encryption, DH 2, etc see profile). Initial IKE_INIT_SA using UDP port 500 and subsequently using UDP port 4500 (NAT support required).	**P**	

Test ID	Cell Broadcast	Result	Comments
ACME_AP_07	Demonstrate that the AP is given an in-tunnel IP address from the pool provided.	**P**	

ACME_AP_08	Demonstrate that if there is a mismatch in Trust Anchors that the AP will not connect to a Security Gateway that it does not trust. This test is to check that the Security Gateway copes properly with the AP refusing to proceed with the connection due to the mismatch.	**P**	
ACME_AP_09	Demonstrate that if there is a mismatch in Trust Anchors that the Security Gateway will not accept an AP connection that it does not trust.	**P**	
ACME_AP_10	Demonstrate that the Security Gateway refuses IPsec connection from an AP that has an out-of-date certificate. (Use a Test Certificate on the AP).	**P**	
ACME_AP_11	Demonstrate that the IKE SA may be rekeyed repeatedly with the AP tunnel and the tunnels of other APs continuing to work. Demonstrate that rekey is successful while a UE has a speech call up, without any degradation of the voice quality.	**P**	
ACME_AP_12	Demonstrate that the CHILD SA may be rekeyed repeatedly with the AP tunnel and the tunnels of other APs continuing to work. Demonstrate that rekey is successful while a UE has a speech call up, without any degradation of the voice quality.	**P**	
ACME_AP_14	Demonstrate that the AP copes when the tunnel from Security Gateway killed.	**P**	
ACME_AP_15	Demonstrate that the AP sends new request to establish new tunnel when IPsec disabled and enabled in AP.	**P**	
ACME_AP_20	Demonstrate that the Security Gateway refuses connection from an AP that has a revoked certificate.	**P**	
ACME_AP_21	Establish tunnel from Femto side. Reboot client and ensure Dead Peer Detection clears tunnel on gateway side	**P**	

ACME_AP_22	Verify that the received IKE_AUTH message has TSr of 0.0.0.0/0 and the traffic-selector parameter that is defined in the MSG is included in the TSr of MSG's auth message (single traffic selector)	**P**	
ACME_AP_23	Verify that when there is no intersection between the received proposed TSr and the configured traffic-selectors, the MSG rejects the IKE_AUTH message with an TS_UNACCEPTABLE message.	**P**	
ACME_AP_24	Verify that the MSG correctly performs the intersection of a single received proposed TSr address with the configured traffic-selectors in determining the TSr listed in the MSG's AUTH message.	**P**	
ACME_AP_25	Verify that the MSG correctly performs the intersection of multiple received proposed TSr address with the configured traffic-selectors in determining the TSr listed in the MSG's AUTH message TSr payloads.	**P**	
ACME_AP_26	Support for multiple DNS servers in IKE negotiation	**P**	

Total: 22

Standalone

Test ID	Standalone	Result	Comments
ACME_AP_13	Demonstrate that the Security Gateway copes successfully when it is rebooted with several APs that have tunnels active. The APs must be able to set up new tunnels: the Security Gateway must not keep alive old tunnels for which it has lost state information.	**P**	

Total: 1

Redundancy

Test ID	Redundancy	Result	Comments
ACME_AP_16	Demonstrate that when the active Security Gateway is powered off that the passive Security Gateway takes control within one second and that AP tunnels in use remain up and operational.	**P**	
ACME_AP_17	Demonstrate that IPsec tunnels can continue to be set up and taken down on the active unit following a fail-over. Verify that the tunnels can be used for CS and PS calls from a UE through to the 3GAC.	**P**	
ACME_AP_18	Demonstrate that disconnecting the failover synchronisation cables for a period during which existing tunnels remain in effect and also new tunnels are created, and old tunnels are removed, that when the cables are reconnected that the system is still capable of correct fail-over, carrying all working IPsec tunnels with it ok.	**P**	
ACME_AP_19	Demonstrate that following multiple fail-overs the Security Gateway continues to work, with ability to create new IPsec tunnels and remove old tunnels, and maintain existing tunnels. Also that rekey will occur ok for both IKE and CHILD SAs for existing and new tunnels.	**P**	

Summary

This section provides a statistical summary of the testing.

Section	Total no. of tests	P	F	NP	NT	P*	UT
IPsec & Traffic	22						
Standalone	1						
Redundancy	4						
Total	27		0	0	0	0	0

Conclusions and Recommendations

The integration and interoperability between ip.access nano3G UTRAN N3G_2.0.5 and Oracle Communications Security Gateway has been completed successfully. No open issues reported.

Appendix B – Oracle Communications Security Gateway SW 3.0 highlights

This section highlights some of the important additions and feature inclusions in Oracle Communications Security Gateway SW 3.0 and the hardware requisite. (For detailed features and description, please review the Oracle Communications Security Gateway MC-X 3.0 Essentials Guide – February 2014)

Acme Packet 4500 platform support

10G 2 port ETC2 NIU with Cavium (SW 2.0 requires 4x1G HiFN based NIU)

IPv6 support (configuration and new show commands)

- IPv6 IKE interface, IPv6 peer support
- IPv6 local address pool
- IPv6 tunnels (local address assignment as well as via external Radius server)
- IPv6 contents in IDi, IDr, Traffic selector, CFG_REQUEST and CFG_REPLY payloads

Certicate related changes (SHA-256 support, subject alternative name extension support, Key Usage extension)

Authentication/Authorization server per ike-interface

Persistent tunnel addressing (resume previously assigned tunnel local address in case of UE reboot)

Configure multiple traffic selectors

For upgrading an exsiting Oracle Communications Security gateway Acme Packet 4500 platform which is installed and running with 4x1G NIU and SW 2.0 to SW 3.0m2p1, please peruse and follow instructions specified in document – **"Oracle Communications Security Gateway – MOP for Installation of 10G ETC2 NIU and upgrade existing 4500 system to SW 3.0m2p2"**

Appendix C – Reference configuration (Use of CRL)
